Materials to be used for containment liners and attachments to liners are listed in Appendix I, Table I-2.2.

CC-2512 Permitted Stainless Steel Specifications

When the desired type of approved stainless steel is lacking in the specification covering the applicable form, the material may be furnished to the general requirements of an approved specification with the chemical composition and mechanical properties conforming to those shown in another approved specification for the desired grade.

CC-2513 Permitted Clad Plate Specifications

(a) Clad plate used in construction in which the design calculations are based on the total thickness including cladding shall conform to one of the following specifications:

- (1) SA-263, Corrosion-Resisting Chromium-Nickel Clad Plate, Sheet and Strip;
- (2) SA-264, Corrosion-Resisting Chromium-Nickel Steel Clad Plate, Sheet and Strip.

1—STATIC TENSILE TEST

Specimen No.	Effective Area, sq in.	Yield Load, lb	Tensile Load, lb	Yield Strength, psi	Tensile Strength, psi	Elongation in 100, %	Number of Failed Wires/Strands

2—HIGH CYCLE DYNAMIC TENSILE TEST

Specimen No.	Effective Area, sq in.	Low Load, lb	High Load, lb	Low Stress, psi	High Stress, psi	Cycle Period

3—LOW CYCLE DYNAMIC TENSILE TEST

Specimen No.	Effective Area, sq in.	Low Load, lb	High Load, lb	Low Stress, psi	High Stress, psi	Cycle Period

**FIG. CC-2465-1 RECORD OF MECHANICAL TEST RESULTS OBTAINED FROM
—TENDON PERFORMANCE QUALIFICATION TESTS**

FIG. CC-2465-1 RECORD OF MECHANICAL TEST RESULTS OBTAINED FROM TENDON PERFORMANCE QUALIFICATION TESTS

(b) Clad plate used in construction in which the design calculations are based on the clad-plate thickness, exclusive of the thickness of the cladding material, may consist of any base plate material satisfying the requirements of CC-2511 and any metallic cladding material of weldable quality that in the judgment of the user is suitable for the intended service.

(c) Integrally clad steel plate, in which any part of the cladding is included in the design calculations, shall show a minimum shear strength of 20,000 psi (138 MPa) when tested in the manner described in the plate specification. One shear test shall be made on each such clad plate as-rolled, and the results shall be reported on the CMTR.

(d) When any part of the cladding thickness is specified as an allowance for corrosion, such added thickness shall be removed before mill tension tests are made. When no part of the cladding thickness is specified as an allowance for corrosion, the cladding material need not be removed before testing.

CC-2514 Permanent Structural Attachment Material

Structural steel rolled shapes, which are permitted by CC-2121 to be furnished with a certificate of compliance, may be repaired by welding using the welders, documentation, and examination requirements specified in SA-6.

CC-2520 FRACTURE TOUGHNESS REQUIREMENTS FOR MATERIALS

CC-2521 Materials to Be Impact Tested

CC-2521.1 Materials for Which Impact Testing Is Required.

Carbon steel and low alloy steel for liners shall be tested either by drop weight tests or the Charpy V-notch impact test. Such tests are not required for:

(a) materials with a nominal section thickness of $\frac{5}{8}$ in. (16 mm) or less where the thickness shall be taken as defined in (1) through (4) below:

(1) for liners, use the nominal thickness of the shell or head as applicable;

(2) for nozzles or parts welded to liners, use the lesser of the liner thickness to which the item is welded, or the maximum radial thickness of the item exclusive of integral shell butt welding projections;

(3) for flat heads or flanges, use the maximum shell thickness associated with the butt welding hub;

(4) for integral fittings used to attach process piping to the liner (Fig. NE-1120-1), use the larger nominal thickness of the pipe connections.

(b) studs, attached to the liner, with a nominal size of 1 in. diameter or less;

(c) bars with a nominal cross-sectional area which does not exceed 1 sq in. (645 mm²);

(d) austenitic stainless steels;

(e) all thicknesses of material for pipe, tube, and fittings with a nominal pipe size of 6 in. and smaller;

(f) material for fittings with pipe connections of $\frac{5}{8}$ in. (16 mm) nominal wall thickness and less;

(g) bolting, including studs, nuts, and bolts with a nominal size of 1 in. or less;

(h) materials listed in Table CC-2521.1-1 for which the listed value of T_{NDT}^3 satisfied the equation, $T_{NDT}(\text{LSMT}-A)$, where LSMT⁴ is the lowest service metal temperature specified in the Construction Specification and A is a temperature increment determined from Fig. CC-2521.1-1. This exemption does not apply to either the weld metal impact tests required by CC-2612 or the welding procedure qualification impact tests required by CC-4533.5.

(i) material for which the lowest service metal temperature exceeds 150°F (66°C);

³ T_{NDT} - temperature at or above the nil-ductility transition temperature NDT (ASTM E 208); T_{NDT} is 10°F below the temperature at which at least two specimens show no-break performance.

⁴ The lowest service metal temperature shall be the lowest temperature which the metal may experience in service while the plant is in operation and shall be established by appropriate calculations based on atmospheric ambient conditions, the insulation or enclosure provided, and the minimum temperature which will be maintained inside the containment during the plant operation.

**TABLE CC-2521.1-1
EXEMPTIONS FROM IMPACT TESTING
UNDER CC-2521.1(h)**

Material [Note (1)]	Material Condition [Note (2)]	T_{NDT} , °F [Note (3)]
SA-537 Class 1	N	-30
SA-516 Grade 70	Q & T	-10
SA-516 Grade 70	N	0
SA-508 Class 1	Q & T	+10
SA-299 [Note (4)]	N	+20
SA-216 Grades WCB, WCC	Q & T	+30
SA-36 Plate	HR	+40

NOTES:

- (1) These materials are exempt from toughness testing when A or LSMT - T_{NDT} is above the curve in Fig. CC-2521.1-1 for the thickness as defined in CC-2524.2.1 or CC-2524.2.2.
- (2) Material Condition letters refer to:
N — Normalize
Q & T — Quench and Temper
HR — Hot Rolled
- (3) These values for T_{NDT} were established from data on heavy section steel (thickness greater than $2\frac{1}{2}$ in.). Values for sections less than $2\frac{1}{2}$ in. thick are held constant until additional data are obtained.
- (4) Materials made to a fine grain melting practice.

TABLE CC-2521.1-1 EXEMPTIONS FROM IMPACT TESTING UNDER CC-2521.1(h)

(j) material for embedment anchors when the maximum stress does not exceed 6000 psi (41 MPa) tension or is in compression;

(k) rolled structural shapes, when the thickness of a flange is $\frac{5}{8}$ in. (16 mm) or less.

CC-2522 Impact Test Procedures

CC-2522.1 Types of Tests

CC-2522.1.1 Drop Weight Tests

- (a) The drop weight test, when required, shall be performed in accordance with ASTM E 208, Standard Method for Conducting Drop Weight Test to Determine Nil-Ductility Temperature for Ferritic Steels.
- (b) Type P1, P2, or P3 specimens shall be prepared in accordance with ASTM E 208.

CC-2522.1.2 Charpy V-Notch Tests.

Charpy V-notch test (C_v), when required, shall be performed in accordance with SA-370. Specimens shall be in accordance with SA-370, Fig. 11, Type A. A test shall consist of a set of three full-size 10 mm × 10 mm specimens.

FIG. CC-2521.1-1 DETERMINATION OF PERMISSIBLE LOWEST SERVICE METAL TEMPERATURE

CC-2523 Test Specimens

CC-2523.1 Location of Test Specimens.

Impact test specimens shall be removed from a depth within the material that is at least as far from the material surface as that specified for tensile test specimens in the material specification. For bolting, the C_v impact test specimens shall be taken with the longitudinal axis of the specimen located at least one-half radius or 1 in. (25 mm) below the surface plus the machining allowance per side, whichever is less. The fracture plane of the specimen shall be at least one diameter or thickness from the heat treated end.

CC-2523.2 Orientation of Test Specimens

(a) Impact test specimens for Charpy V-notch tests shall be oriented in accordance with the requirements given for tensile test specimens in SA-370.

(b) Specimens for drop weight tests may have their axes oriented in any direction.

CC-2523.3 Structural Shapes.

The location and orientation of impact test specimens for structural shapes shall be as specified in ASTM A 673.

CC-2524 Test Requirements and Acceptance Standards

CC-2524.1 Liner Material Test Method and Temperature

(a) Liner material shall be impact tested in accordance with one of the test methods indicated below:

(1) Charpy V-notch testing at or below the lowest service metal temperature;⁵

(2) Drop weight testing to establish a T_{NDT} and demonstrate that $T_{NDT} \leq (\text{LSMT} - A)$.

(b) In addition, when the Construction Specification requires that the pneumatic pressure test (CC-6000) be performed at a temperature which is lower than the LSMT, the impact tests for liner material shall be performed in accordance with (a) above, at or below the lowest specified test temperature.

⁵ The requirements for impact testing of the heat affected zone (CC-4533.5) may result in reduced impact test temperatures for the base material.

⁶ The lowest overpressure test metal temperature shall be the lowest temperature which the metal may experience during the overpressure test and shall be established by appropriate calculations based on atmospheric conditions, the insulation or enclosure provided, and the temperature which will be maintained inside the vessel during the test.

As an alternative, a lowest overpressure test metal temperature⁶ shall be specified. In this case, Charpy V-notch testing, in addition to the tests required by (a) above, shall be performed as specified in CC-2522.1.2 at a temperature 30°F (17°C) or more below the lowest overpressure test metal temperature in accordance with CC-2524.4.

TABLE CC-2524.2-1
REQUIRED C_v LATERAL EXPANSION VALUES^{1,2}
FOR LINER MATERIAL OTHER THAN BOLTING

Nominal Wall Thickness, in.	Lateral Expansion, mils	
	Average of 3	Lowest 1 of 3
$\frac{5}{8}$ in. or less [Note (3)]	...	...
Over $\frac{5}{8}$ in. to 1 in., incl.	20	15
Over 1 in. to $1\frac{1}{2}$ in., incl.	25	20
Over $1\frac{1}{2}$ in. to $2\frac{1}{2}$ in., incl.	35	30
Over $2\frac{1}{2}$ in. [Note (4)]	45	40

NOTES:

- (1) Where weld metal tests of CC-2600 are made to these requirements, the impact lateral expansion shall conform to the requirements of either of the base materials being joined.
- (2) Where two base materials having different required lateral expansion values are joined, the weld metal lateral expansion requirements of CC-4533 shall conform to the requirements of either of the base materials.
- (3) No test required.
- (4) For use with CC-2524.2.2.

TABLE CC-2524.2-1 REQUIRED C_v LATERAL EXPANSION VALUES^{1,2} FOR LINER MATERIAL OTHER THAN BOLTING

CC-2524.2 Specific Test Methods and Acceptance Standards for Liner Material for Tests Based on Lowest Service Metal Temperature

CC-2524.2.1 Liner Material With $2\frac{1}{2}$ in. (64 mm) Maximum Thickness.

Except as limited in CC-4533.5, apply one of the methods of CC-2524.1(a) to test the following:

- (a) the base material;

(b) the base material, the heat affected zone, and the weld metal for the weld procedure qualification tests of CC-4533.5;

(c) the weld metal for CC-2612.1.

The impact test results shall meet one of the acceptance standards applicable to the specified test method.

(a) *Charpy V-Notch Testing for Lateral Expansion Values.* The test results of the three specimens collectively and singly shall meet the respective requirements of Table CC-2524.2-1.

(b) *Charpy V-Notch Testing for Absorbed Energy Values.* The test results of the three specimens collectively and singly shall meet the respective requirements of Table CC-2524.2-2.

(c) *Drop Weight Testing.* An acceptance test shall consist of at least two no-break specimens as described in ASTM E 208.

**TABLE CC-2524.2-2
REQUIRED C_V ENERGY VALUES¹ FOR LINER MATERIAL OTHER THAN BOLTING**

Nominal Wall Thickness, in.	Energy, ft-lb, for Base [Note (2)] Materials for Specified Minimum Yield Strength, ksi					
	55 ksi or below		Over 55 ksi to 75 ksi, incl.		Over 75 ksi to 105 ksi, incl.	
	Average of 3	Lowest 1 of 3	Average of 3	Lowest 1 of 3	Average of 3	Lowest 1 of 3
5/8 in. or less [Note (3)]	...	...	...	...	...	...
Over 5/8 in. to 1 in., incl.	20	15	25	20	30	25
Over 1 in. to 1 1/2 in., incl.	25	20	30	25	35	30
Over 1 1/2 in. to 2 1/2 in., incl.	35	30	40	35	45	40
Over 2 1/2 in. [Note (4)]	45	40	50	45	55	50

NOTES:

- (1) Where weld metal tests of CC-2600 are made to these requirements, the impact energy shall conform to the requirements of either of the base materials being joined.
- (2) Where two base materials having different required energy values are joined, the weld metal impact energy requirements of the procedure qualification tests of CC-4533 shall conform to the requirements of either of the base materials.
- (3) No test required.
- (4) For use with CC-2524.2.2.

TABLE CC-2524.2-2 REQUIRED C_V ENERGY VALUES¹ FOR LINER MATERIAL OTHER THAN BOLTING

CC-2524.2.2 Liner Material With Thickness Exceeding 2 1/2 in.

(a) The base material and the weld procedure qualification weld metal tests of CC-4533.5 shall be tested by the drop weight method as specified in CC-2522.1.1 and CC-2524.1(a)(2).

(b) Except as limited in CC-4533.5, apply one of the methods of CC-2524.1(a) to test the base material and the heat affected zone of the weld procedure qualification tests for CC-4533.5 and the weld metal for CC-2612.1.

(c) The acceptance standards shall be given in CC-2524.2.1(a), (b), or (c), as applicable.

CC-2524.3 Bolting Material.

The drop weight test is not applicable to bolting materials. For bolting material including nuts, studs, and bolts, a Charpy V-notch test shall be performed. Optionally, the test may be performed at the lowest service metal temperature or at a temperature 30°F (17°C) or more below the lowest service metal temperature.

(a) When tested at the lowest service metal temperature, lateral expansion and absorbed energy values shall be determined and all three specimens shall meet the requirements of Table CC-2524.3(a)-1.

(b) When tested at 30°F (17°C) or more below the lowest service metal temperature, lateral expansion and absorbed energy values shall be determined and all three specimens shall meet the requirements of Table CC-2524.3(b)-1.

**TABLE CC-2524.3(a)-1
REQUIRED C_v VALUES FOR BOLTING MATERIAL
TESTED IN ACCORDANCE WITH CC-2524.3(a)**

Nominal Diameter, in.	Lateral Expansion, mils	Absorbed Energy, ft-lb
1 or less	No test required	No test required
Over 1 through 4	25	No requirements
Over 4	25	45

TABLE CC-2524.3(a)-1 REQUIRED C_v VALUES FOR BOLTING MATERIAL TESTED IN ACCORDANCE WITH CC-2524.3(a)

**TABLE CC-2524.3(b)-1
REQUIRED C_v VALUES FOR BOLTING MATERIAL
TESTED IN ACCORDANCE WITH CC-2524.3(b)
AND CC-2524.4**

Nominal Diameter, in.	Lateral Expansion, mils	Absorbed Energy, ft-lb
1 or less	No test required	No test required
Over 1 through 4	15	30
Over 4	20	35

TABLE CC-2524.3(b)-1 REQUIRED C_v VALUES FOR BOLTING MATERIAL TESTED IN ACCORDANCE WITH CC-2524.3(b) AND CC-2524.4

CC-2524.4 Specific Test Methods and Acceptance Standards for Liner Material for Tests Based on Lowest Overpressure Test Metal Temperature

CC-2524.4.1 Liner Material.

Apply the method of CC-2524.1(a)(1) to test the following:

Page 34

TABLE CC-2524.4-1
REQUIRED C_v ENERGY VALUES¹ FOR LINER
MATERIAL FOR THE OVERPRESSURE TEST

Nominal Wall Thickness, in.	Energy, ft-lb, for Base ² Materials of Specified Minimum Tensile Strength, ksi			
	60 ksi or below		Over 60 ksi	
	Average of 3	Lowest 1 of 3	Average of 3	Lowest 1 of 3
$\frac{5}{8}$ in. or less [Note (3)]	...	...	...	...
Over $\frac{5}{8}$ in.	15	10	20	15

NOTES:

- (1) Where weld metal tests of CC-2600 are made to these requirements, the impact energy shall conform to the requirements of either of the base materials being joined.
- (2) Where two base materials having different required energy values are joined, the weld metal impact energy requirements of the procedure qualification tests of CC-4533 shall conform to the requirements of either of the base materials.
- (3) No test required.

TABLE CC-2524.4-1 REQUIRED C_v ENERGY VALUES¹ FOR LINER MATERIAL FOR THE OVERPRESSURE TEST

(a) the base material;

(b) the base material, the heat affected zone, and the weld metal for the weld procedure qualification tests of CC-4533.5;

(c) the weld metal for CC-2612.1.

The impact test results of the three specimens collectively and singly shall meet the respective requirements of Table CC-2524.4-1.

CC-2524.4.2 Bolting Material.

For bolting material including nuts, studs, and bolts, a Charpy V-notch test shall be performed. Lateral expansion and absorbed energy values shall be determined and all three specimens shall meet the requirements of Table CC-2524.3(b)-1.

CC-2524.5 Data to Be Reported

(a) When Charpy V-notch tests are performed to meet the requirements of CC-2520, the test temperature, absorbed energy, lateral expansion, and percent shear shall be reported on the Certified Material Test Report.

(b) When drop weight tests are performed to meet the requirements of CC-2520, the test temperature and the results shall be reported on the Certified Material Test Report.

CC-2525 Number of Impact Tests Required

CC-2525.1 Plate.

One test shall be made from each plate as heat treated. Where plates are furnished in the nonheat-treated condition and qualified by heat treated test specimens, one test shall be made for each plate as-rolled. The term *as-rolled* refers to the ingot plate rolled from a slab or directly from an ingot, not to its heat treated condition.

CC-2525.2 Forgings and Castings.

When an individual forging or casting is less than 1000 lb (454 kg), one test shall be made to represent each heat in each heat treatment charge. When heat treatment is performed in continuous-type furnaces with suitable temperature controls and equipped with recording pyrometers so that complete heat treatment records are available, a heat treatment charge shall be considered as any continuous run not exceeding 8 hr duration or a total weight, so treated, not exceeding 2000 lb (907 kg). One test shall be made for each forging or casting of 1000 to 10,000 lb (454 to 4,540 kg) in weight. Ring or disk forgings, or castings larger than 10,000 lb (4,540 kg), shall have two tests per part for Charpy V-notch and one test for drop weight. The location of drop weight or Charpy V-notch test specimens shall be selected so that an equal number of specimens is obtained from positions in the forging or casting 180 deg. apart. When a separate forging or casting is used to represent forgings or castings of any size, one test shall be required.

CC-2525.3 Tubular Products and Fittings.

On products which are seamless or welded without filler metal, one test shall be made from each lot. On products which are welded with filler metal, one additional test with the specimens taken from the weld area shall also be made on each lot. A *lot* shall be defined as stated in the applicable material specification, but in no case shall a lot consist of products from more than one heat of material and of more than one diameter, with the nominal thickness of any product included not exceeding that to be impact tested by more than $\frac{1}{4}$ in. (6 mm). Such a lot shall be in a single heat treatment load or in the same continuous run in a continuous-type furnace controlled within a 50°F (28°C) range and equipped with recording pyrometers.

CC-2525.4 Bolting Material.

One test shall be made for each lot of material where a *lot* is defined as one heat of material heat treated in one charge or as one continuous operation, not to exceed the following:

$1\frac{3}{4}$ in. diameter and less	1,500 lb
Over $1\frac{3}{4}$ in. to $2\frac{1}{2}$ in. diameter	3,000 lb
Over $2\frac{1}{2}$ in. to 5 in. diameter	6,000 lb
Over 5 in. diameter	10,000 lb

CC-2525.5 Bars and Rolled Shapes

(a) One test shall be made for each lot of bars with a cross-sectional area greater than 1 sq in. (645 mm²)

where a *lot* is defined as one heat of material heat treated in one charge or as one continuous operation, not to exceed 6000 lb (2720 kg).

(b) For rolled shapes, the frequency of testing shall be one test (a set of three specimens) for at least each 15 tons (13,608 kg) or each single length of 15 tons (13,608 kg) or more, of the same nominal shape size, excluding length, for each heat in the as-rolled condition. If the shapes are heat treated, one test shall be taken from each heat of each nominal shape size, excluding length, in each furnace lot. For shapes heat treated in a continuous furnace, a lot shall not exceed 15 tons (13,608 kg).

CC-2526 Test Coupon Heat Treatment for Ferritic Material⁷

Where ferritic steel material is subject to heat treatment during fabrication or installation of a liner, the material used for the tensile and impact test specimens shall be heat treated in the same manner as the liner, except that test coupons and specimens for P-No. 1 materials with a nominal thickness of 2 in. or less are not required to be so heat treated. The Fabricator shall provide the Material Manufacturer with the temperature and heating and cooling rates to be used. In the case of postweld heat treatment, the total time at temperature or temperatures for the test material shall be at least 80% of the total time at temperature or temperatures during actual postweld heat treatment of the material, and the total time at temperature or temperatures for the test material may be performed in a single cycle.

CC-2527 Retests

CC-2527.1 Retests for Material Other Than Bolting

(a) For Charpy V-notch tests required by CC-2524, one retest at the same temperature may be conducted provided:

(1) the average value of the test results meets the average of three requirements specified in Table CC-2524.2-1, CC-2524.2-2, or CC-2524.4-1, as applicable;

(2) not more than one specimen per test is below the lowest one of three requirements specified in Table CC-2524.2-1, CC-2524.2-2, or CC-2524.4-1b, as applicable;

⁷ Any postweld heat treatment time which is anticipated to be applied to the material during fabrication or construction after completion of manufacture shall be specified in the Construction Specification. The Material Manufacturer shall include this time in the total time at temperature specified to be applied to the test specimens.

(3) the specimen not meeting the requirements is not lower than 5 ft-lb (6.8J) or 5 mils (0.13 mm) below the lowest one of three requirements specified in Table CC-2524.2-1, CC-2524.2-2, or CC-2524.4-1, as applicable.

(b) A retest consists of two additional specimens taken as near as practicable to the failed specimens. For acceptance of the retests, both specimens shall be equal to or greater than the average of three requirements specified in Table CC-2524.2-1, CC-2524.2-2, or CC-2524.4-1, as applicable.

CC-2527.2 Retests for Bolting Material

(a) For Charpy V-notch tests required by CC-2524, one retest at the same temperature may be conducted provided:

(1) not more than one specimen per test is below the acceptance requirements;

(2) the specimen not meeting the acceptance requirements is not lower than 5 ft-lb (6.8J) or 5 mils (0.13 mm) below the acceptance requirements.

(b) A retest consists of two additional specimens taken as near as practicable to the failed specimens. For acceptance of the retests, both specimens shall meet the specified acceptance requirements.

CC-2528 Calibration of Instruments and Equipment

Calibration of temperature instruments and Charpy V-notch impact test machines used in impact testing shall be performed at the following frequency.

(a) Temperature instruments used to control test temperature of specimens shall be calibrated and the results recorded to meet the requirements of NCA-3868 at least once in each 3 month interval.

(b) Charpy V-notch impact test machines shall be calibrated and the results recorded to meet the requirements of NCA-3868. The calibrations shall be performed at least once per year using methods outlined in ASTM E 23 and employing standard specimens obtained from the U.S. Army Materials Research Center.

CC-2530 EXAMINATION AND REPAIR OF LINER MATERIAL

CC-2531 Liner Material

Liner material shall be examined and repaired in accordance with the material specification and as otherwise required by this Article.

Page 36

CC-2532 Examination After Quenching and Tempering

Ferritic steel products which are used in the quenched and tempered condition shall be examined by the methods specified in this Article for each product form after the quenching and tempering phase of the heat treatment.

CC-2533 Examination and Repair of Plate

CC-2533.1 Required Examination.

Plates shall be examined in accordance with the requirements of the material specification.

CC-2533.2 Time of Examination.

Acceptance examinations shall be performed at the following times.

(a) Examinations shall be performed as required by the material specification.

(b) Radiographic examination of repair welds, when performed, may be performed prior to or after any required postweld heat treatment.

(c) Ultrasonic examination shall be performed after heat treatment.

(d) Magnetic particle or liquid penetrant examination of repair welds shall be performed after any required postweld heat treatment except for P-No. 1 material, which may be examined before or after any required postweld heat treatment.

CC-2533.3 Elimination of Surface Defects.

Unacceptable surface defects may be removed by grinding or machining provided:

(a) the depression, after defect elimination, is blended uniformly into the surrounding surface;

(b) elimination of the defect does not reduce the required section thickness by more than $\frac{1}{16}$ in. (1.6 mm);

(c) if the elimination of the defect reduces the required thickness of the section by more than $\frac{1}{16}$ in. (1.6 mm), the product shall be repaired by welding in accordance with CC-2533.4 or rejected.

CC-2533.4 Repair by Welding.

The Material Manufacturer may repair by welding materials from which defects have been removed, provided the requirements of the following subparagraphs are met. Prior approval of the Certificate of Authorization Holder shall be obtained.

CC-2533.4.1 Defect Removal.

The defect shall be removed or reduced to an acceptable size by suitable mechanical or thermal cutting or gouging

methods, and the cavity prepared for welding. The area shall be examined by magnetic particle or liquid penetrant testing before repair by welding. When thermal cutting and gouging methods are used, preheating in accordance with CC-4521.1.1 shall be used.

CC-2533.4.2 Qualification of Welding Procedures and Welders.

The welding procedures and welders or welding operators shall be qualified in accordance with CC-4500 and Section IX.

CC-2533.4.3 Blending of Repaired Areas.

After repair, the surface shall be blended uniformly into the surrounding surface.

CC-2533.4.4 Examination of Repair Welds.

Each repair weld shall be examined by the magnetic particle method or by the liquid penetrant method. In addition, when the depth of the repair cavity exceeds the lesser of $\frac{3}{8}$ in. (10 mm) or 50% of the section thickness, the weld repair shall be radiographed and evaluated to the acceptance standards of CC-5542. The penetrameter and the acceptance standards for radiographic examination of repair welds shall be based on the section thickness of the repair area.

CC-2533.4.5 Heat Treatment After Repairs.

The product shall be heat treated after repair in accordance with the heat treatment requirements of CC-4554.

CC-2533.4.6 Material Report Describing Defects and Repairs.

Each defect repair exceeding $\frac{3}{8}$ in. (10 mm) in depth or 50% of the section thickness shall be described in the CMTR when the repair is made by the Material Manufacturer. The CMTR for each piece shall include a chart which shows the location and size of the prepared cavity, the welding material identification, the welding procedure, the heat treatment, and a report of the results of the examinations, including radiographic film.

CC-2534 Examination and Repair of Forgings and Bars

CC-2534.1 Required Examinations.

Forgings and bars shall be examined visually for the presence of chip marks, blemishes, or other surface irregularities.

CC-2534.2 Time of Examination.

Acceptance examinations shall be performed at the time of manufacture and in accordance with CC-2533.1.

CC-2534.3 Elimination of Surface Defects.

Elimination of surface defects shall be made in accordance with CC-2533.3.

CC-2534.4 Repair by Welding.

Repair by welding shall be made in accordance with CC-2533.4.

Page 37

CC-2535 Examination of Wrought Seamless and Welded (Without Filler Metal) Tubular Products and Fittings

In addition to the requirements of the material specification and of this Article, seamless and welded (without filler metal) tubular products shall comply with the following.

CC-2535.1 Wrought Seamless and Welded (Without Filler Metal) Pipe and Tubing.

Wrought seamless and welded (without filler metal) pipe and tubing shall comply with the requirements for Class 2 seamless and welded (without filler metal) pipe and tubing of SA-655, Special Requirements for Pipe and Tubing for Nuclear and Other Special Applications.

CC-2535.2 Wrought Seamless and Welded (Without Filler Metal) Fittings.

Wrought seamless and welded (without filler metal) fittings shall comply with the requirements of SA-652, Special Requirements for Wrought Steel Welding Fittings for Nuclear and Other Special Applications, for Class 2 seamless or Class 2 welded (without filler metal) fittings.

CC-2536 Examination and Repair of Tubular Products and Fittings Welded With Filler Metal

CC-2536.1 Required Examination

(a) Welded (with filler metal) tubular products, such as pipe made in accordance with SA-358 and fittings made in accordance with the WPW grades of SA-234, SA-403, and SA-420, which are made by welding with filler metal, shall be treated as material; however, inspection by an Inspector and stamping with an NPT symbol shall be in accordance with the material specification. In addition to the NPT symbol, a numeral 2 shall be stamped below and outside the official Code symbol.

(b) In addition to the requirements of the material specification and of this Article, pipe and fittings shall comply with the following.

(1) Pipe shall comply with the requirements of SA-655, Special Requirements for Pipe and Tubing for Nuclear and Other Special Applications, for Class 2 welded (with filler metal) pipe.

(2) Fittings shall comply with the requirements of SA-652, Special Requirements for Wrought Steel Welding Fittings for Nuclear and Other Special Applications, for Class 2 welded (with filler metal) fittings.

(c) Tubular products and fittings which have been radiographed shall be marked to indicate that radiography has been performed. The radiographic film and a radiographic report showing film locations shall be provided with the Certified Material Test Report.

(d) The Authorized Inspector shall certify by signing the Partial Data Report Form NM-1 (Appendix V of Section III, Division 1, Appendices) in accordance with NCA-5290.

CC-2537 Examination and Repair of Statically and Centrifugally Cast Products

CC-2537.1 Required Examinations.

Cast material shall be examined by either radiographic or ultrasonic methods, or a combination of the two methods. Castings or sections of castings, which have coarse grains or configurations which do not yield meaningful results by ultrasonic examination, shall be examined by radiographic methods.

CC-2537.2 Ultrasonic Examination of Ferritic Steel Castings.

The requirements for ultrasonic examination of statically and centrifugally cast products are given in the following subparagraphs.

CC-2537.2.1 Straight Beam Method.

When ferritic castings are to be examined ultrasonically, all sections, regardless of thickness, shall be examined in accordance with SA-609, Specification for Longitudinal Beam Ultrasonic Inspection of Carbon and Low-Alloy Steel Castings; however, supplementary angle beam examination in accordance with CC-2537.2.2 or radiographic examination in accordance with CC-2537.3 shall be performed in areas where a back reflection cannot be maintained during the straight beam examination or where the angle between the two surfaces of the casting is more than 15 deg.

CC-2537.2.2 Angle Beam Method.

Examinations shall be conducted in accordance with T-540 of Section V, except that the acceptance standards of CC-2537.2.3 apply.

CC-2537.2.3 Acceptance Standards

(a) The Quality Levels of SA-609 shall apply for the casting thicknesses indicated in (1) through (3) below:

- (1) Quality Level 1 for thicknesses up to 2 in. (51 mm);
- (2) Quality Level 3 for thicknesses 2 in. to 4 in. (102 mm);
- (3) Quality Level 4 for thicknesses greater than 4 in. (102 mm);

(b) In addition to the Quality Level requirements stated in (a) above, the requirements in (1) through (5) below shall apply for both straight beam and angle beam examination.

Page 38

(1) Areas giving indications exceeding the Amplitude Reference Line with any dimension longer than those specified in the following tabulation are unacceptable:

UT Quality Level	Longest Dimension of Area, in.
1	1.5
2	2.0
3	2.5
4	3.0

NOTES:

(1) The area for the Ultrasonic Quality Levels in SA-609 refers to the surface area on the casting over which a continuous indication exceeding the corrected transfer distance amplitude curve is maintained.

(2) Area is to be measured from dimensions of the movement of the search unit, using the center of the search unit as the reference point.

(3) In certain castings, because of very long metal path distances or curvature of the examination surfaces, the surface area over which a given discontinuity is detected may be considerably larger or smaller than the actual area of the discontinuity in the casting; in such cases, other criteria which incorporate a consideration of beam angles or beam spread must be used for realistic evaluation of the discontinuity.

(2) Quality Level 1 shall apply for the volume of castings within 1 in. (25 mm) of the surface regardless of the overall thickness.

(3) Discontinuities indicated to have a change in depth equal to or greater than one-half the wall thickness or 1 in. (25 mm), whichever is less, are unacceptable.

(4) Two or more indications in the same plane, with amplitudes exceeding the Amplitude Reference Line and separated by a distance less than the longest dimension of the larger of the adjacent indications, are unacceptable if they cannot be encompassed within an area less than that of the Quality Level specified in (b)(1) above.

(5) Two or more indications greater than permitted for Quality Level 1 for castings less than 2 in. (51 mm) in thickness, greater than permitted for Quality Level 2 for thicknesses 2 in. (51 mm) through 4 in. (102 mm), and greater than permitted for Quality Level 3 for thicknesses greater than 4 in. (102 mm), separated by a distance less than the longest dimension of the larger of the adjacent indications, are unacceptable if they cannot be encompassed in an area less than that of the Quality Level requirements stated in (a) above.

CC-2537.3 Radiographic Examination

CC-2537.3.1 Extent, Methods, and Acceptance Standards.

Radiographic examination, when required, shall be performed on castings. The extent of radiographic coverage shall be of the maximum feasible volume. The radiographic methods shall be in accordance with ASTM E 94,

shall be of the maximum feasible volume. The radiographic methods shall be in accordance with ASTM E 94, Recommended Practice for Radiographic Testing, and ASTM E 142, Controlling Quality of Radiographic Testing, and shall meet the acceptance requirements of Severity Level 2 of ASTM E 446, Reference Radiographs for Steel Castings up to 2 in. (51 mm) in Thickness, ASTM E 186, Reference Radiographs for Heavy-Walled (2 to 4¹/₂ in.) (102 mm to 114 mm) Steel Castings, or ASTM E 280, Reference Radiographs for Heavy-Walled (4¹/₂ to 12 in.) (114 mm to 305 mm) Steel Castings, as applicable, for the thickness being radiographed (except that Category D, E, F, or G defects are not acceptable). The requirements of ASTM E 280 shall apply for castings over 12 in. in thickness.

NOTE: The reference radiographs accompanying previous editions of ASTM E 186, E 280, and E 446 may be used with later editions of the specification provided the text of the specified edition is used.

CC-2537.3.2 Procedure.

The supplemental requirements of (a) through (d) below apply to the radiographic methods specified by ASTM E 94 and ASTM E 142.

(a) Type 4 film is not permitted.

(b) For those areas where relatively uniform thicknesses occur, the minimum film density shall be 1.5 for single viewing and 2.0 for composite viewing of multiple film exposures; each film of a composite set shall have a minimum density of 1.0, and the maximum film density permitted shall be 4.0.

(c) For those sections where the thickness varies sufficiently to cause difficulty in meeting the density requirements with one penetrometer, two penetrameters shall be used representing the thinnest and thickest sections in the area to be interpreted. Densities at or between the densities on the penetrameters shall be considered acceptable, except that the minimum density of the penetrometer image shall be 1.3 for single film viewing and 2.0 for composite film viewing of multiple film exposures; each film of a composite set shall have a minimum density of 1.0.

(d) The radiographic quality level shall be 2-4T for section thicknesses up to and including ³/₄ in. (19 mm) and 2-2T for section thicknesses greater than ³/₄ in. (19 mm) Radiographic quality is defined in Note 2 of ASTM E 94.

CC-2537.4 Magnetic Particle Examination

CC-2537.4.1 Examination Procedure.

The procedure for magnetic particle examination shall be in accordance with the methods of Article 7 of Section V.

CC-2537.4.2 Evaluation of Indications

(a) Mechanical discontinuities at the surface will be indicated by the retention of the examination medium.

Page 39

All indications are not necessarily defects, however, since certain metallurgical discontinuities and magnetic permeability variations may produce similar indications which are not relevant to the detection of unacceptable discontinuities.

(b) Any indication in excess of the CC-2537.4.3 acceptance standards which is believed to be nonrelevant shall be regarded as a defect and shall be reexamined to verify whether or not actual defects are present. Surface conditioning may precede the reexamination. Nonrelevant indications which would mask indications of defects are unacceptable.

(c) Relevant indications are those which result from unacceptable mechanical discontinuities. Linear indications are those indications in which the length is more than three times the width. Rounded indications are indications which are circular or elliptical with the length less than three times the width. Indications resulting from nonmetallic inclusions are not considered relevant indications.

CC-2537.4.3 Acceptance Standards

(a) Only indications with major dimensions greater than ¹/₁₆ in. shall be considered relevant.

(b) The relevant indications of (1) through (4) below are unacceptable:

(1) any linear indications greater than $\frac{1}{16}$ in. (1.6 mm) long for material less than $\frac{5}{8}$ in. (16 mm) thick, greater than $\frac{1}{8}$ in. (3.2 mm) long for material from $\frac{5}{8}$ in. (16 mm) thick to under 2 in. (51 mm) thick, and $\frac{3}{16}$ in. (4.8 mm) long for material 2 in. (51 mm) thick and greater;

(2) rounded indications with dimensions greater than $\frac{1}{8}$ in. (3.2 mm) for thickness less than $\frac{5}{8}$ in. (16 mm), and greater than $\frac{3}{16}$ in. (4.8 mm) for thicknesses $\frac{5}{8}$ in. (16 mm) and greater;

(3) four or more indications in a line separated by $\frac{1}{16}$ in. (1.6 mm) or less edge to edge;

(4) ten or more indications in any 6 sq in. (3871 mm²) of area whose major dimension is no more than 6 in. (152 mm), with the dimensions taken in the most unfavorable location relative to the indications being evaluated.

CC-2537.5 Liquid Penetrant Examination

CC-2537.5.1 Examination Procedure.

The procedure for liquid penetrant examination shall be in accordance with the methods of Article 6 of Section V.

CC-2537.5.2 Evaluation of Indications

(a) Mechanical discontinuities at the surface will be indicated by bleeding out of the penetrant; however, localized surface imperfections such as may occur from machining marks or surface conditions may produce similar indications which are not relevant to the detection of unacceptable discontinuities.

(b) Any indication in excess of the CC-2537.5.3 acceptance standards which is believed to be nonrelevant shall be regarded as a defect and shall be reexamined to verify whether or not actual defects are present. Surface conditioning may precede the reexamination. Nonrelevant indications and broad areas of pigmentation which would mask indications of defects are unacceptable.

(c) Relevant indications are those which result from unacceptable mechanical discontinuities. Linear indications are those indications in which the length is more than three times the width. Rounded indications are indications which are circular or elliptical with the length less than three times the width.

CC-2537.5.3 Acceptance Standards

(a) Only indications with major dimensions greater than $\frac{1}{16}$ in. shall be considered relevant.

(b) The relevant indications of (1) through (4) below are unacceptable:

(1) any linear indications greater than $\frac{1}{16}$ in. (1.6 mm) long for material less than $\frac{5}{8}$ in. (16 mm) thick, greater than $\frac{1}{8}$ in. (3.2 mm) long for material from $\frac{5}{8}$ in. (16 mm) thick to under 2 in. (51 mm) thick, and $\frac{3}{16}$ in. (4.8 mm) long for material 2 in. (51 mm) thick and greater;

(2) rounded indications with dimensions greater than $\frac{1}{8}$ in. (3.2 mm) for thicknesses less than $\frac{5}{8}$ in. (16 mm), and greater than $\frac{3}{16}$ in. (4.8 mm) for thicknesses $\frac{5}{8}$ in. (16 mm) and greater;

(3) four or more indications in a line separated by $\frac{1}{16}$ in. (1.6 mm) or less edge to edge;

(4) ten or more indications in any 6 sq in. (3871 mm²) of area whose major dimension is no more than 6 in. (152 mm) with the dimensions taken in the most unfavorable location relative to the indications being evaluated.

CC-2537.6 Time of Examination.

Acceptance examinations, including those for weld repairs, shall be performed at the time of manufacture as stipulated in the following subparagraphs.

CC-2537.6.1 Ultrasonic Examination.

Ultrasonic examination, if required, shall be performed at the stage of manufacture as required for radiography.

CC-2537.6.2 Radiographic Examination.

Radiography, when required, may be performed prior to heat treatment, and shall be performed at the stage of manufacture defined in this subparagraph. Castings, prior to finish machining, shall be radiographed at the limiting thicknesses stipulated in (a) and (b) below.

Page 40

(a) For thicknesses less than 6 in. (152 mm), castings shall be radiographed within 20% of the finished thickness. The penetrameter shall be based on the final thickness.

(b) For thicknesses 6 in. (152 mm) and greater, castings shall be radiographed within 10% of the finished thickness. The penetrameter shall be based on the final thickness.

CC-2537.6.3 Magnetic Particle or Liquid Penetrant Examination.

Magnetic particle or liquid penetrant examination shall be performed after the final heat treatment required by the material specification. Repair weld areas shall be examined after postweld heat treatment when a postweld heat treatment is performed, except that repair welds to P-No. 1 material 2 in. (51 mm) nominal thickness and less may be examined prior to postweld heat treatment. For cast products with machined surfaces, all finished machined surfaces, except threaded surfaces, shall also be examined by magnetic particle or liquid penetrant methods.

CC-2537.7 Elimination of Surface Defects.

Elimination of surface defects shall be in accordance with CC-2533.4.

CC-2537.8 Repair by Welding.

The Material Manufacturer may repair castings by welding after removing the material containing unacceptable defects. The depth of the repair is not limited. A cored hole or access hole may be closed by the Material Manufacturer by welding in accordance with the requirements of this paragraph, provided the hole is closed by filler metal only. If the hole is closed by welding in a metal insert, the welding shall be performed by a Certificate Holder in accordance with the requirements of CC-4000.

CC-2537.8.1 Defect Removal.

Prior to repair by welding, material containing unacceptable defects shall be removed by suitable mechanical or thermal cutting or gouging methods to sound metal or until any defect remaining is within the acceptance standards, and the cavity shall be prepared for welding.

CC-2537.8.2 Qualification of Welding Procedures and Welders.

The welding procedure and welders or welding operators shall be qualified in accordance with CC-4000 and Section IX.

CC-2537.8.3 Blending of Repaired Areas.

After welding, the surface shall be blended uniformly into the surrounding surface.

CC-2537.8.4 Examination of Repair Welds.

Each repair weld shall be examined by the magnetic particle method (CC-2537.4) or by the liquid penetrant method (CC-2537.5). In addition, when radiography of the casting is required, repair welds in cavities, the depth of which exceeds the lesser of $\frac{3}{8}$ in. (10 mm) or 10% of the section thickness, shall be radiographed in accordance with CC-2537.3. The radiographic method and acceptance standards of CC-2537.3 shall apply, except that weld slag, including elongated slag, shall be considered as an inclusion under Category B of the applicable reference radiographs. The total area of all inclusions, including slag inclusions, shall not exceed the limits of the applicable severity level of Category B of the reference radiographs.

CC-2537.8.5 Heat Treatment After Weld Repair.

After repair, the casting shall be heat treated in accordance with CC-4552, except that the heating and cooling limitations of CC-4552.3 do not apply.

CC-2537.8.6 Material Report Describing Defects and Repairs.

Each repair weld exceeding in depth either $\frac{3}{8}$ in. or 10% of the section thickness shall be described in the Certified Material Test Report. The Certified Material Test Report shall include a chart for each repaired casting, which shows the location and size of the repaired cavity, the welding material identification, the welding procedure, the heat treatment, and the examination results, including radiographic film.

CC-2540 MATERIAL IDENTIFICATION

The identification of liner material shall meet the requirements of NCA-3866.6 except that materials for leak-chase systems, embedments, and attachments may be bundled and tagged when permitted by the SA material specifications. Materials for small items shall be controlled during manufacture so that they are identifiable as acceptable materials at all times. Welding materials shall be controlled during the repair of material and the manufacture of liners so that they are identifiable as acceptable until the materials are actually consumed in the process (CC-4122).

CC-2600 WELDING MATERIAL

CC-2610 WELDING MATERIAL REQUIREMENTS

All welding materials used in the construction and repair of components or materials, except welding materials used for hard surfacing, shall conform to the requirements of the welding material specification or to the requirements for other welding materials as

Page 41

permitted by Section IX. In addition, welding materials shall conform to the requirements of this Subarticle.

CC-2611 Required Tests

(a) The required tests shall be conducted:

- (1) for each *lot* of covered, flux cored, or fabricated electrodes;
- (2) for each *heat* of bare electrodes, rod, or wire for use with the FGW, GMAW, GTAW, PAW, and EGW (electrode gas welding) processes (QW-492 of Section IX);
- (3) for each *heat* of backing filler metal (consumable inserts);
- (4) for each combination of *heat* of bare electrodes and *lot* of submerged arc flux;
- (5) for each combination of *lot* of fabricated electrodes and *lot* of submerged arc flux;
- (6) for each combination of *heat* of bare electrodes and *lot* of electroslag flux;

(b) Tests performed on welding material during the qualification of weld procedures shall satisfy the testing requirements for the lot, heat, or combination of heat and batch of welding material used, provided the tests required by CC-4533 and this Subarticle are made and the results conform to the requirements of this Subarticle. The definitions of (1) through (7) below apply.

(1) A *dry batch* of covering mixture is the quantity of dry covering ingredients mixed at one time in one mixing vessel; a dry batch may be used singly or may be subsequently subdivided into quantities to which the liquid binders may be added to produce a number of wet mixes (3).

(2) A *dry blend* is defined as one or more dry batches mixed in a mixing vessel and combined proportionately to produce a uniformity of mixed ingredients equal to that obtained by mixing the same total amount of dry ingredients at one time in one mixing vessel.

(3) A *wet mix* is the combination of a dry batch (1) or dry blend (2) and liquid binder ingredients at one time in one mixing vessel.

(4) A *lot of covered, flux cored, or fabricated electrodes* is defined as the quantity of electrodes produced from the same combination of heat of metal and dry batch or dry blend of flux or core materials. Alternatively, a lot of covered, flux cored, or fabricated electrodes may be considered one type and size of electrode, produced in a continuous period, not to exceed 24 hr and not to exceed 100,000 lb (45,360 kg), from chemically controlled tube, wire or strip, and chemically controlled mixes of flux, provided each container of welding materials is coded for identification and traceable to the production period, the shift, line, and the analysis range of both the mix and the rod, tube, or strip used to make the electrode.

(a) *Chemically controlled tube, wire, or strip* is defined as consumable tube, wire, or strip material supplied on coils with a maximum of one splice per coil that has been chemically analyzed to assure that the material conforms to the electrode Manufacturer's chemical control limits for the specific type of electrode. Both ends of each coil shall be chemically analyzed, except that those coils which are splice free need only be analyzed on one end of the coil.

(b) *Chemically controlled mixes of flux* are defined as flux material that has been chemically analyzed to assure that it conforms to the percent allowable variation from the electrode Manufacturer's standard for each chemical element for that type electrode. A chemical analysis shall be made on each mix made in an individual mixing vessel after blending.

(5) A *heat of bare electrode, rod, wire, or consumable insert* is defined as the material produced from the same melt of metal.

(6) Alternatively, for carbon and low alloy steel bare electrode, rod, wire, or consumable inserts for use with SAW, FGW, GMAW, GTAW, PAW, and EGW processes, a *heat* may be defined as either the material produced from the same melt of metal, or the material produced from one type and size of wire when produced in a continuous period, not to exceed 24 hr and not to exceed 100,000 lb (45,360 kg), from chemically controlled wire subject to the requirements of (a), (b), and (c) below.

(a) For the chemical control of the product of the rod mill, coils shall be limited to a maximum of one splice prior to processing the wire. Chemical analysis shall be made from a sample taken from both ends of each coil of mill coiled rod furnished by mills permitting spliced coil practice of one splice maximum per coil. A chemical analysis need be taken from only one end of rod coils furnished by mills prohibiting spliced coil practice.

(b) Carbon, manganese, silicon, and other intentionally added elements shall be determined to identify the material to ensure that it conforms to the SFA or user's material specification.

(c) Each container of wire shall be coded for identification and traceability to the lot, production period, shift, line, and analysis of rod used to make the wire.

(7) A *lot of submerged arc or electroslag flux* is defined as the quantity of flux produced from the same combination of raw materials under one production schedule.

CC-2612 Weld Metal Tests

CC-2612.1 Mechanical Properties Tests.

Tensile and impact tests shall be made for welding material which is used to join P-No. 1 base material with the exceptions listed below:

(a) austenitic stainless steel welding material used to join P-No. 1 base material;

(b) consumable inserts (backing filler material);

(c) welding material to be used for the welding of base material exempted from impact testing by CC-2521.1(a) through (g) shall likewise be exempted from the impact testing required by this paragraph.

CC-2612.1.1 General Test Requirements.

The welding test coupon shall be made in accordance with the requirements of (a) through (f) below for each process with which the weld material will be used in production welding.

(a) Test coupons shall be of sufficient size and thickness so that the required test specimens can be removed.

(b) The weld metal to be tested for all processes except electroslag welding shall be deposited in such a manner as to substantially eliminate the influence of the base material on the results of the tests. Weld metal to be used with the electroslag process shall be deposited in such a manner as to conform to one of the applicable Welding Procedure Specifications (WPS) for production welding, Section IX, QW-201.1. The base material shall conform with the requirements of Section IX, QW-403.1 or QW-403.4, as applicable.

(c) The welding of the test coupon shall be performed with the range of preheat and interpass temperatures that will be used in production welding. Coupons shall be tested in the as-welded condition, or, where indicated by the WPS, they shall be postweld heat treated⁶ to the specified temperatures. The postweld heat treatment holding time shall be at least 80% of the maximum time to be applied to the weld metal in production application. The total time for postweld heat treatment of the test coupon may be applied in one heating cycle. The cooling rate from the postweld heat treatment temperature shall be of the same order as that applicable to the weld metal in the component. In addition, weld coupons for weld metal to be used with the electroslag process that are tested in the as-welded condition, or following a postweld heat treatment within the holding temperature ranges of Table CC-4552-1 or CC-4552-3, shall have a thickness within the range of 0.5 to 1.1 times the thickness of the welds to be made in production. Electroslag weld coupons to be tested following a postweld heat treatment, which will include heating the coupon to a temperature above the holding temperature range of Table CC-4552-1 for the type of material being tested, shall have a thickness within the range of 0.9 to 1.1 times the thickness of the welds to be made in production.

(d) Regardless of the welding process or welding material being tested, the tensile specimens and the Charpy V-notch impact specimens, where required, shall be located and prepared in accordance with the requirements of SFA-5.1, Specification for Mild Steel Covered Electrodes. Drop weight impact test specimens, where used, shall be oriented so that the longitudinal axis is transverse to the weld with the notch in the weld face, or in a plane parallel to the weld face. For impact specimen preparation and testing, the applicable parts of CC-2522.1.1 and CC-2522.1.2 shall apply. The longitudinal axis of the specimens shall be at a minimum depth of $1/4t$ from a surface, where t is the nominal thickness of the test weld.

(e) One all-weld-metal tensile specimen shall be tested and shall meet the specified minimum tensile strength requirements of the base material specification. Where base materials of different specifications are to be welded, the tensile strength requirements shall conform to the specified minimum tensile strength requirements of either of the base material specifications.

(f) Impact specimens of the weld metal shall be tested where impact tests are required for either of the base materials of the production weld. The weld metal shall conform to the parts of CC-2524.2.1, CC-2524.2.2, or CC-2524.4.1, as applicable.

CC-2612.1.2 Standard Test Requirements.

In lieu of the use of the general test requirements specified in CC-2612.1.1, tensile and impact tests may be made in accordance with this paragraph where they are required for mild and low alloy steel covered electrodes. The material combinations to require weld material testing as listed in CC-2612.1 shall apply for the standard test requirements option. The limitations and testing under the standard test option shall be in accordance with (a) through (f) below.

(a) Testing to the requirements of this subparagraph shall be limited to electrode classifications included in SFA-5.1 or SFA-5.5.

(b) The test assembly required by SFA-5.1 or SFA-5.5, as applicable, shall be used for test coupon preparation, except that it shall be increased in size to obtain the number of Charpy V-notch specimens or the drop weight test specimens required by CC-2524 or CC-2525, where applicable.

(c) The welding of the test coupon shall conform to the requirements of the SFA specification for the classification of electrode being tested. Coupons shall

be tested in the as-welded condition and also in the postweld heat treated condition. The postweld heat treatment temperature shall be in accordance with Table CC-4552-1 for the applicable P-Number equivalent. The time at postweld heat treatment temperature shall be 8 hr, which qualifies postweld heat treatments of 10 hr or less. Where the postweld heat treatment (PWHT) of the production weld exceeds 10 hr, or the PWHT temperature is other than that required above, the general test of CC-2612.1.1 shall be used.

**TABLE CC-2613.1-1
SAMPLING OF WELDING MATERIALS FOR
CHEMICAL ANALYSIS**

	GTAW/ PAW	GMAW	All Other Processes
A-No. 8 filler metal	Filler metal or weld deposit	Weld deposit	Weld deposit
All other filler metal	Filler metal or weld deposit	Filler metal or weld deposit	Weld deposit

TABLE CC-2613.1-1 SAMPLING OF WELDING MATERIALS FOR CHEMICAL ANALYSIS

(d) The tensile and Charpy V-notch specimens shall be located and prepared in accordance with the requirements of SFA-5.1 or SFA-5.5, as applicable. Drop weight impact test specimens, where required, shall be located and oriented as specified in CC-2612.1.1(d).

(e) One all-weld-metal tensile specimen shall be tested and shall meet the specified minimum tensile strength requirement of the SFA specification for the applicable electrode classification.

(f) The requirements of CC-2612.1.1(f) shall be applicable to the impact testing of the standard test.

CC-2613 Chemical Analysis Test

Chemical analysis of filler metal or weld deposits shall be made in accordance with CC-2611 and as required by the following subparagraphs.

CC-2613.1 Test Method.

The chemical analysis test shall be performed in accordance with this subparagraph and Table CC-2613.1-1, and the

results shall conform to CC-2613.2.

(a) A-No. 8 welding material to be used with gas tungsten-arc welding (GTAW) and plasma-arc welding (PAW) processes and any other welding material to be used with any GTAW, PAW, or GMAW process shall have chemical analysis performed on either the filler metal or on a weld deposit made with the filler metal in accordance with (c) or (d) below.

(b)(1) A-No. 8 welding material to be used with other than the GTAW and PAW processes and other welding materials to be used with other than the GTAW, PAW, or GMAW process shall have chemical analysis performed on a weld deposit of the material or combination of materials being certified in accordance with (c) and (d) below. The removal of chemical analysis samples shall be from an undiluted weld deposit made in accordance with (c) below.

(2) As an alternative, the deposit shall be made in accordance with (d) for material that will be used for corrosion resistant overlay cladding. Where the Welding Procedure Specification or the welding material specification specifies percentage composition limits for analysis, it shall state that the specified limits apply for the filler metal analysis, the undiluted weld deposit analysis, or for in situ cladding deposit analysis in conformance with the above required certification testing.

(c) The preparation of samples for chemical analysis of undiluted weld deposits shall comply with the method given in the applicable SFA specification. Where a weld deposit method is not provided by the SFA specification, the sample shall be removed from a weld pad, groove, or other test weld⁸ made using the welding process that will be followed when the welding material or combination of welding materials being certified is consumed. The weld for A-No. 8 material to be used with the GMAW or EGW process shall be made using the shielding gas composition specified in the Welding Procedure Specification that will be followed when the material is consumed.

The test sample for ESW shall be removed from the weld metal of the mechanical properties test coupon. Where a chemical analysis is required for a welding material which does not have a mechanical properties test requirement, a chemical analysis test coupon shall be prepared as required by CC-2612.1.1(c), except that heat treatment of the coupon is not required and the weld coupon thickness requirements of CC-2612.1.1(c) do not apply.

⁸ The methods given in the Appendix of SFA-5.9, Specification for Corrosion-Resisting Cr and Cr-Ni Steel Welding Rods and Bare Electrodes, shall be used to establish a welding and sampling method for the pad, groove, or other test weld to ensure that the weld deposit being sampled will be substantially free of base metal dilution.

(d) The alternative method provided in (b)(2) above for the preparation of samples for chemical analysis of welding material to be used for corrosion resistant overlay cladding shall require a test weld made in accordance with the essential variables of the Welding

Procedure Specification that will be followed when the welding material is consumed. The test weld shall be made in conformance with the requirements of Section IX, QW-214.1. The removal of chemical analysis sample shall conform with QW-214.3 for the minimum thickness for which the Welding Procedure Specifications are qualified.

TABLE CC-2613.2-1
WELDING MATERIAL CHEMICAL ANALYSIS

Cr-Ni stainless materials	C, Cr, Mo, Ni, Mn, Si, Cb
----------------------------------	----------------------------------

TABLE CC-2613.2-1 WELDING MATERIAL CHEMICAL ANALYSIS

CC-2613.2 Requirements for Chemical Analysis.

The chemical elements to be determined, the composition requirements of the weld metal, and the recording of results of the chemical analysis shall be in accordance with (a), (b), and (c) below.

(a) Welding material of ferrous alloy A-No. 8 (QW-442, Section IX) shall be analyzed for the elements listed in Table CC-2613.2-1 and for any other elements specified either in the welding material specification referenced by the Welding Procedure Specification or in the Welding Procedure Specification.

(b) The chemical composition of the weld metal or filler metal shall conform to the welding material specification for elements having specified percentage composition limits. Where the Welding Procedure Specification contains a modification of the composition limits of SFA or other referenced welding material specifications, or provides limits for additional elements, these composition limits of the Welding Procedure Specification shall apply for acceptability.

(c) The results of the chemical analysis shall be reported in the Certified Material Test Report. Elements listed in Table CC-2613.2-1, but not specified in the welding material specification or Welding Procedure Specification, shall be reported for information only.

CC-2613.3 Delta Ferrite Determination.

A determination of delta ferrite shall be performed on A-No. 8 weld material (QW-442, Section IX), backing filler metal (consumable inserts), bare electrode, rod, or wire filler metal, or weld metal, except that delta ferrite determinations are not required for SFA-5.4, Type 16-8-2, or A-No. 8 weld filler metal to be used for weld metal cladding.

CC-2613.3.1 Method.

Delta ferrite determinations of welding material, including consumable insert material, shall be made using a magnetic measuring instrument and weld deposits made in accordance with (b) below. Alternatively, the delta ferrite determinations for welding materials may be performed by the use of chemical analysis of CC-2613 in conjunction with Fig. CC-2613.3.1-1.

(a) Calibration of magnetic instruments shall conform to AWS-A4.2-74.

(b) The weld deposit for magnetic delta ferrite determination shall be made in accordance with CC-2613.1(c).

(c) A minimum of six ferrite readings shall be taken on the surface of the weld deposit. The readings obtained shall be averaged to a single Ferrite Number.

CC-2613.3.2 Acceptance Standards.

The minimum acceptable delta ferrite shall be 5FN (Ferrite Number). The results of the delta ferrite determination shall be included in the Certified Material Test Report of CC-2130 or CC-4120.

CC-2614 Storage and Handling of Welding Material

Suitable storage and handling of electrodes, flux, and other welding material shall be maintained. Precautions shall be taken to minimize absorption of moisture by fluxes and cored, fabricated, and coated electrodes.

CC-2620 STUD WELDING MATERIAL

CC-2621 General Requirements

CC-2621.1 Material Specifications.

Stud material shall conform to ASTM A 108, Cold Finished Carbon Steel Bars and Shafting, Grades 1010, 1015, 1016, 1018, or 1020, and to the additional requirements described in this paragraph.

CC-2621.2 Definitions

- (a) Stud base as used herein shall be considered as the stud tip at the welding end, including flux and container, and 1/8 in. (3.2 mm) of the body of the stud adjacent to the tip.
- (b) Angle of bend in testing studs as used herein shall be measured between the original axis of the base material and a line passing through the centers of the two ends of the bent stud.

CC-2621.3 Stud Design.

Studs shall be of a design suitable for arc welding to steel members with automatically timed stud welding equipment. The type, size or diameter, and length of stud shall be as specified by the Construction Specification. Dimensions and tolerances of standard type studs are given in Fig. CC-2620-1.

FIG. CC-2613.3.1-1 DELTA FERRITE CONTENT

FIG. CC-2613.3.1-1 DELTA FERRITE CONTENT

STANDARD DIMENSIONS, IN.

C	Length, L , Tolerances	H	T
$1/2$ $+0.000$ -0.010	$+1/16$ $-1/8$	$1 \pm 1/64$	$9/32$ min.
$5/8$ $+0.000$ -0.010	$+1/16$ $-1/8$	$1-1/4 \pm 1/64$	$9/32$ min.
$3/4$ $+0.000$ -0.015	$+1/16$ $-1/8$	$1-1/4 \pm 1/64$	$3/8$ min.
$7/8$ $+0.000$ -0.015	$+1/16$ $-1/8$	$1-3/8 \pm 1/64$	$3/8$ min.

FIG. CC-2620-1 DIMENSIONS AND TOLERANCES
OF STANDARD STUDS

FIG. CC-2620-1 DIMENSIONS AND TOLERANCES OF STANDARD STUDS

CC-2621.4 Surface Condition.

Finished studs shall be of uniform quality and condition, free of injurious laps, fins, seams, cracks, twists, bends, or other injurious defects. A stud with cracks or bursts deeper than one-half the distance from the periphery of the head to the shank shall be cause for rejection.⁹

CC-2622 Stud Base Requirements

CC-2622.1 Arc Shield.

An arc shield (ferrule) of heat resistant ceramic or other suitable material shall be furnished with each stud.

CC-2622.2 Flux.

A suitable deoxidizing and arc stabilizing flux for welding shall be furnished with each stud of $\frac{5}{16}$ in. (8 mm) diameter or larger. Studs less than $\frac{5}{16}$ in. (8 mm) diameter may be furnished with or without flux.

CC-2622.3 Base.

The stud base shall not be painted, galvanized, or plated.

CC-2622.4 Qualification Requirements

CC-2622.4.1 Introduction.

The stud base qualification tests described in this subparagraph shall constitute qualification of stud bases with the same geometry, material, flux, and arc shield, of the same diameter and down to but not including $\frac{1}{8}$ in. (3.2 mm) and smaller nominal diameters.

CC-2622.4.2 Duration of Qualification.

A size of stud base with arc shield, once qualified, is considered qualified until the Manufacturer makes any change in the stud base geometry, material, flux, or arc shield.

CC-2622.4.3 Preparation of Specimens

(a) Test specimens shall be prepared by welding representative studs to suitable plates of P-No. 1 material. Tests for threaded studs shall be on blanks (studs without threads).

(b) Studs shall be welded with power source, welding gun, and automatically controlled equipment. Welding voltage, current, and time shall be measured and recorded for each specimen.

⁹ Heads of studs are subject to cracks or bursts, which are terms that designate an abrupt interruption of the periphery of the head of the stud by radial separation of the metal. Such interruptions do not adversely affect the structural strength, corrosion resistance, or other functional requirements of studs.

CC-2622.4.4 Number of Test Specimens

(a) Thirty test specimens shall be welded consecutively with constant optimum time but with current 10% above optimum. Optimum current and time shall

be the midpoint range normally recommended for production welding.

FIG. CC-2620-2 TYPICAL TENSILE TEST FIXTURE

FIG. CC-2620-2 TYPICAL TENSILE TEST FIXTURE

(b) Thirty test specimens shall be welded consecutively with constant optimum time but with current 10% below optimum.

CC-2622.4.5 Tensile Tests

(a) *Number of Tests.* Ten of the specimens welded in accordance with CC-2622.4.4(a) and 10 in accordance with CC-2622.4.4(b) shall be subjected to a tensile test in a fixture similar to that shown in Fig. CC-2620-2, except that studs without heads may be gripped on the unwelded end in the jaws of the tensile testing machine.

(b) *Acceptance Standards.* A stud base shall be considered qualified if all test specimens have a tensile strength equal to or greater than 60.0 ksi (410 MPa).

CC-2622.4.6 Bend Tests

(a) *Number of Tests.* Twenty of the specimens welded in accordance with CC-2622.4.4(a) and 20 in accordance with CC-2622.4.4(b) shall be bend tested by being bent alternately 30 deg. in opposite directions until failure occurs. Studs shall be bent in a bend testing device as shown in Fig. CC-2620-3, except that studs less than $\frac{1}{2}$ in. diameter may be bent using a device as shown in Fig. CC-2620-4.

(b) *Acceptance Standards.* A stud base shall be considered qualified if, on all test specimens, fracture occurs in the shank of the stud or plate material and not in the weld or heat affected zone.

CC-2622.4.7 Retests.

If failure occurs at less than the specified minimum tensile strength of the stud during tensile tests, or in the weld or heat affected zone during bend testing, a new test group as specified in CC-2622.4.4(a) or CC-2622.4.4(b) shall be made and tested. If such failure is repeated, the lot of studs represented shall not be acceptable.

Page 48

GENERAL NOTE:

Fixture holds specimen and stud is bent 30 deg. in opposite directions alternately. Load can be applied with hydraulic cylinder (shown) or fixture adopted for use with tensile test machines.

FIG. CC-2620-3 BEND TESTING DEVICE

FIG. CC-2620-3 BEND TESTING DEVICE

CC-2622.4.8 Acceptance Standards.

For a Manufacturer's stud base and arc shield combination to be qualified, each stud of each group of 30 studs shall, by test or retest, meet the requirements of CC-2622.4.5 and CC-2622.4.6. Qualification of a given diameter of

shall, by test or retest, meet the requirements of CC-2622.4.5 and CC-2622.4.6. Qualification of a given diameter of stud base shall be considered qualification for stud bases of the same nominal diameter, stud base geometry, material flux, and arc shield.

CC-2623 Stud Requirements

CC-2623.1 Chemical Analysis.

A chemical analysis shall be made of each heat of stud material. The analysis shall conform to that required for the material specification.

CC-2623.2 Tensile Requirements

CC-2623.2.1 Tensile Tests.

Tensile tests shall be made on each heat of bar stock after drawing or on full-diameter finished studs. Tensile testing shall be performed in accordance with the applicable paragraphs of SA-370. When the tensile requirements for shear connector studs are determined from finished studs, the tensile tests may be made on studs welded to test plates of P-No. 1 material, using a test fixture similar to that shown in Fig. CC-2620-2. When the tensile requirements for studs other than shear connectors are determined from finished studs, the ends of the studs may be gripped in the jaws of a tensile testing machine. Plates of adequate size may be fillet welded to the unwelded end for studs without heads. If fracture occurs outside the middle half of the gage length, the test shall be repeated.

CC-2623.2.2 Acceptance Standards.

Studs are classified into four types according to strength levels. The tensile test specimens shall conform to the requirements of each type as shown in Table CC-2623.2-1.

CC-2624 Documentation Requirements

The following information shall be incorporated into the Certified Material Test Report (CMTR) in accordance with CC-2130:

- (a) drawings showing shape and dimensions, with tolerances, of studs, arc shields, and flux (when used);
- (b) results of stud base qualification requirements, including a description of the quantity and type of flux, and a description of the arc shield;
- (c) chemical analysis of the bar stock;
- (d) tensile test results from stud tensile tests;
- (e) drawing showing shape and dimensions with tolerances of studs, arc shields, and flux, when used.

TABLE CC-2623.2-1 STRENGTH REQUIREMENTS FOR STUDS

CC-2630 IDENTIFICATION OF WELDING MATERIAL

- (a) The identification of welding material (including stud welding material) shall meet the requirements of NCA-3866.6(b).
- (b) Welding material shall be controlled during the repair of material and the manufacture and installation of components so that they are identifiable as accepted material until the material is actually consumed in the process (CC-4122).

CC-2700 MATERIAL FOR EMBEDMENT ANCHORS

CC-2710 INTRODUCTION

This Subarticle establishes the requirements for load bearing steel materials that are embedded in the concrete containment to perform a containment function. These requirements do not apply to liner, liner attachments or anchor components of prestressing systems.

CC-2711 Permitted Material Specifications

The material to be used for the construction of embedment anchors are listed in Table I-2.3 of Appendix I. Material listed in Table I-2.2 may also be used.

CC-2712 Requirements for Nuts and Washers

- (a) Material for nuts shall conform to ASTM A 563 or to the requirements for nuts in the specification for the bolting material which is to be used.
- (b) Nuts shall be threaded to Class 2B or finer tolerances according to ANSI B1.1. Materials for nuts and washers shall be selected as follows.
- (1) Carbon steel nuts and carbon steel washers may be used with carbon steel bolts or studs.
 - (2) Carbon or alloy steel nuts and carbon or alloy steel washers of approximately the same hardness as the nuts may be used with alloy steel bolts or studs.
- (c) Nuts shall be semifinished, extra heavy, chamfered and trimmed.

CC-2720 FRACTURE TOUGHNESS REQUIREMENTS FOR EMBEDMENT ANCHOR

MATERIALS

Fracture toughness requirements for embedment anchor materials shall be in accordance with CC-2520.

CC-2730 EXAMINATION AND REPAIR OF EMBEDMENT ANCHOR MATERIAL

CC-2731 Examination and Repair of Embedment Anchor Material Other Than Bolting

(a) Material for embedment anchors shall be examined in accordance with the material specification. Unacceptable defects may be repaired as permitted by the material specification.

(b) Structural steel rolled shapes, which are permitted by the section to be furnished with a certificate of compliance, may be repaired by welding using welders, documentation, and examination requirements specified in SA-6.

CC-2732 Examination of Bolting Material and Rods¹⁰

Bolts, studs, and nuts shall be examined in accordance with the requirements of the material specification and CC-2733.

CC-2733 Visual Examination

The areas of threads, shanks, and heads of final machined parts shall be visually examined. Imperfections, such as laps, seams, or cracks as defined in ASTM F 788 are unacceptable.

CC-2734 Repair by Welding

Weld repairs of bolting material and rods are not permitted.

CC-2740 MARKING OF EMBEDMENT ANCHOR MATERIAL

10 The word rods as used in this Subarticle is intended to cover rods that are threaded. It also includes forged piston rods if they are threaded for a portion of their length. It does not apply to unthreaded bar stock.

CC-2741 Identification

The identification of material requiring Certified Material Test Reports shall meet the requirements of NCA-3866.6. Material furnished with Certificates of Compliance shall be identified by a controlled system meeting the requirements of the applicable material specification, grade, and class. Identification of the material to the Material Manufacturer's Certificate of

Page 51

Compliance is not required after the embedment anchor manufacturer, or after the Material Supplier who furnishes embedment anchors as material has verified that the material meets the requirements of this Section.

Material for small items shall be controlled during the manufacture of the embedment anchor so that they are identifiable as acceptable material at all times. Welding material shall be controlled during the repair of material and the manufacture and installation of embedment anchors so that it is identifiable as acceptable material until the material is actually consumed in the process.

CC-2800 MATERIAL MANUFACTURER'S QUALITY SYSTEM PROGRAMS

CC-2810 DOCUMENTATION AND MAINTENANCE OF QUALITY SYSTEM PROGRAMS

CC-2811 General

Material Manufacturers, Material Suppliers, and Constituent Suppliers shall document and maintain Quality System Programs (NCA-3800, NCA-3900).

CC-2812 Manufacturers of Nonmetallic Material and Constituent Suppliers

Nonmetallic Material Manufacturers and Constituent Suppliers shall have a Quality System Program which meets the

Nonmetallic Material Manufacturers and Constituent Suppliers shall have a Quality System Program which meets the requirements of NCA-3900.

CC-2813 Manufacturers of Metallic Material and Material Suppliers

Material Manufacturers and Material Suppliers shall have a Quality System Program which meets the requirements of NCA-3800.

July 1, 1998

American Society Of Mechanical Engineers

SEC III D2 CC-3000

ARTICLE CC-3000 DESIGN

Page 53

CC-3100 GENERAL DESIGN

CC-3110 CONCRETE CONTAINMENT

- (a) These design criteria apply to concrete containments with steel reinforcement, prestressed tendons or a combination thereof, and metallic liners.
- (b) The requirements for radiation shielding, allowable leak rate, design life span of the structure, and quantitative values of the design loads shall be presented in the Design Specification.
- (c) The metallic liner shall be designed within limits of stress, strain, and deformation specified in this Article.
- (d) The criteria for the containment as demonstrated by the design calculations shall consider factored as well as service load conditions. For factored load conditions, the following requirements shall be met.
 - (1) Primary forces shall not bring the local section to a general yield state with respect to any component of section membrane strain or section flexural curvature. General yield state is the point beyond which additional section deformation occurs without increase in section forces.
 - (2) Under combined primary and secondary forces on a section, the development of a general yield state with respect to those membrane strains and/or flexural curvatures which correspond to secondary stress components is acceptable, subject to rebar and concrete strain limits in CC-3420. The concept of a general yield state is not applicable to strains associated with radial shear stress.
- (e) The design of parts designated to meet the requirements for Class MC and which are not backed up by concrete for load carrying purposes shall meet the requirements of NE-3000 and Subsection NCA.

CC-3120 METALLIC LINER

CC-3121 General

The liner shall not be used as a strength element. Interaction of the liner with the containment shall be considered in determining maximum strains.

CC-3122 Liner

The general requirements to be used in the design of metallic liners are as follows.

- (a) The liner shall be designed to withstand the effects of imposed loads and to accommodate deformation of the concrete containment without jeopardizing leak-tight integrity.
- (b) The liner shall be welded using weld details which do not jeopardize leak-tight integrity of the containment.

(c) The liner shall be anchored to the concrete containment. This does not preclude local flexural deformation between anchor points.

CC-3123 Liner Anchors

(a) The liner anchorage system shall be designed to accommodate all design loads and deformations without loss of structural or leak-tight integrity.

(b) The anchorage system shall be so designed that a progressive failure of the anchorage system is precluded in the event of a defective or missing anchor.

CC-3124 Penetration Assemblies

Penetration assemblies, including nozzles, reinforcing plates, and penetration anchors, shall be designed to accommodate all design loads and deformations without loss of structural or leak-tight integrity. Effects such as temperature, concrete creep, and shrinkage shall be considered.

CC-3125 Brackets and Attachments

Temporary or permanent brackets and attachments shall be designed to resist the design loads without loss of the liner integrity due to excessive deformation or load from bracket or attachment loads.

Page 58

CC-3130 DEFINITION OF TERMS

CC-3131 Service Load Category

Service loads are any loads encountered during construction and in the normal operation of a nuclear power plant. Included in such loads are any anticipated transient or test loads during normal and emergency startup and shutdown of the nuclear steam supply, safety, and auxiliary systems. Also included in this category are those severe environmental loads which may be anticipated during the life of the facility.

CC-3132 Factored Load Category

Factored loads include loads encountered infrequently, such as severe environmental, extreme environmental, and abnormal loads.

CC-3133 Serviceability

Serviceability defines behavior for service or factored load conditions which are not defined by strength or stress limitations. It includes those items where distortion, concrete crack size, or strain are limited. Examples are weathering of concrete, mechanism distortion at hatches and penetrations, liner leakage, and containment interaction with adjacent structures.

CC-3134 Reinforced Concrete

Reinforced concrete is concrete containing reinforcement and designed on the assumption that the two materials act together in resisting forces.

CC-3135 Prestressed Concrete

Prestressed concrete is reinforced concrete in which there have been introduced internal stresses of such magnitude and distribution that the stresses resulting from loads are counteracted to a desired degree.

CC-3136 Stresses and Forces

CC-3136.1 Membrane Stress.¹

Membrane stress is the component of normal stress, hoop or meridional, which is uniformly distributed and equal to the average of stress across the thickness of the section under consideration.

1 As applied in this Division, not to be substituted for principal stress or stress intensity.

CC-3136.2 Bending Stress.

Bending stress is the variable component of normal stress. The variation may or may not be linear across the thickness.

CC-3136.3 Shear Stress.

Shear stress may be radial, tangential, peripheral (punching), or torsional.

(a) Radial shear stress is a flexural shear stress which acts perpendicular to the plane of the wall or other element of the containment structure.

(b) Tangential shear stress is a membrane shear stress which acts in the plane of the wall or other element of the containment structure.

(c) Peripheral shear stress is a shear stress around a punching type shear surface, produced by local externally applied forces acting perpendicular to the plane of the wall or other element.

(d) Torsional shear stress is a stress in the plane of the wall or other element of the containment structure produced by components of local externally applied moments about an axis perpendicular to the wall or other element.

CC-3136.4 Primary Force.

Primary force is a local, internal force (kips/ft) or moment (kip-ft/ft) which is required to equilibrate applied loads. In some regions of the shell, and for some loadings, there is a redundancy of internal force systems. In such cases the primary, load equilibrating force system shall be justified in the Design Report.

CC-3136.5 Secondary Force.

Secondary force is a local, internal force (kips/ft) or moment (kip-ft/ft) which is not required for equilibrating the applied loads. Thus, a secondary force may be either:

(a) a local, internal, force, or moment which results from applied loads, but which is not required to equilibrate such loads; or

(b) a local, internal force, or moment which results from nonload, volume change effects, such as shrinkage strain and thermal strain.

CC-3136.6 Classification of Forces.

Forces shall be classified in accordance with Table CC-3136.6-1.

CC-3140 TOLERANCES

The Construction Specification shall delineate the tolerance requirements for fabrication and construction. The Designer shall ensure that the tolerances specified in the Construction Specification are compatible with the design assumptions.

TABLE CC-3136.6-1
CLASSIFICATION OF FORCES IN CONCRETE CONTAINMENTS FOR STEEL REINFORCING
AND CONCRETE ALLOWABLE STRESSES¹

Location	Origin of Loads	Type of Force	Classification
Regions away from discontinuities	External (2)	Membrane	Primary
		Bending	Primary
		Shear (3)	Primary
	Volume change effects such as creep shrinkage and thermal strains	Membrane	Secondary
		Bending	Secondary
		Shear	Primary
Regions at and near gross changes in shell geometry	External (2)	Membrane	Primary
		Bending	Primary (4)
		Shear	Primary
	Volume change effects such as creep shrinkage and thermal strains	Membrane	Secondary
		Bending	Secondary
		Shear	Primary
Regions near large openings	External (2)	Membrane	Primary
		Bending	Primary
		Shear	Primary
	Volume change effects such as creep shrinkage and thermal strains	Membrane	Secondary
		Bending	Secondary
		Shear	Primary

NOTES:

- (1) Allowable stresses for concrete may be considered secondary in the region defined in CC-3422.1(c)(3).
(2) Includes prestressing.
(3) Includes both radial and tangential shear force.
(4) For allowable stresses, bending at discontinuities due to external loads is considered primary.

TABLE CC-3136.6-1 CLASSIFICATION OF FORCES IN CONCRETE CONTAINMENTS FOR STEEL REINFORCING AND CONCRETE ALLOWABLE STRESSES¹

CC-3200 LOAD CRITERIA

CC-3210 GENERAL

The containment shall be designed to resist the loads and load combinations given in this Article and as specified in the Design Specification (NCA-3250). The design shall not be limited to the loads specified herein if any other loads are applicable to the particular site conditions.

CC-3220 LOAD CATEGORIES

CC-3221 Service Loads

CC-3221.1 Normal Loads.

Normal loads are loads which are encountered during normal plant operation and shutdown.

- D* = dead loads, including hydrostatic and permanent equipment loads
- L* = live loads, including any movable equipment loads and other loads which vary with intensity and occurrence, such as

	soil pressures
F	= loads resulting from the application of prestress
G	= loads resulting from relief valve or other high energy device actuation
T_o	= thermal effects and loads during normal operating or shutdown conditions, based on the most critical transient or steady state condition
R_o	= pipe reactions during normal operating or shutdown conditions, based on the most critical transient or steady state condition
P_v	= external pressure loads resulting from pressure variation either inside or outside the containment

CC-3221.2 Construction Loads.

Construction loads are loads which are applied to the containment from start to completion of construction. The definitions for D , L , F , and T_o given in CC-3221.1 are applicable but shall be based on construction conditions.

Page 60

CC-3221.3 Test Loads.

Test loads are loads which are applied during structural integrity or leak rate testing. The definitions for D , L , and F given in CC-3221.1 are applicable but shall be based on test conditions. In addition, the following shall also be considered:

P_t	= pressure during the structural integrity and leak rate tests
T_t	= thermal effects and loads during the test

CC-3222 Factored Loads

CC-3222.1 Severe Environmental Loads.

Severe environmental loads are loads that could infrequently be encountered during the plant life.

W	= loads generated by the design wind specified for the plant site
E_o	= loads generated by the operating basis earthquake. Only the actual dead load and existing live load weights need be considered in evaluating seismic response forces.

CC-3222.2 Extreme Environmental Loads.

Extreme environmental loads are loads which are credible but are highly improbable.

E_{ss}	= loads generated by the safe shutdown earthquake. Weights considered shall be the same as for E_o .
W_t	= tornado loading including the effects of missile impact. Included in W_t are the following:
W_{tq}	= the loads due to tornado wind pressure

W_{tp}

= the differential pressure loads due to rapid atmospheric pressure change

W_{tm}

= the tornado generated missile impact effects. The type of impact, such as plastic or elastic, together with the ability of the structure to deform beyond yield shall be considered in establishing the structural capacity necessary to resist the impact.

CC-3222.3 Abnormal Loads.

Abnormal loads are loads generated by the design basis accident (DBA).

H_a

= load on the containment resulting from internal flooding, if such an occurrence is defined in the Design Specification as a design basis event

P_a

= Design Pressure load within the containment generated by the DBA, based upon the calculated peak pressure with an appropriate margin

T_a

= thermal effects and loads generated by the DBA including T_o

R_a

= pipe reaction from thermal conditions generated by the DBA including R_o

R_r

= the local effects on the containment due to the DBA. The local effects shall include the following:

R_{rr}

= load on the containment generated by the reaction of a ruptured high energy pipe during the postulated event of the DBA. The time-dependent nature of the load and the ability of the containment to deform beyond yield shall be considered in establishing the structural capacity necessary to resist the effects of R_{rr} .

R_{rj}

= load on the containment generated by jet impingement from a ruptured high energy pipe during the postulated event of the DBA. The time-dependent nature of the load and the ability of the containment to deform beyond yield shall be considered in establishing the structural capacity necessary to resist the effects of R_{rj} .

R_{rm}

= the load on the containment resulting from the impact of a ruptured high energy pipe during the DBA. The type of impact, for example, plastic or elastic, together with the ability of the containment to deform beyond yield shall be considered in establishing the structural capacity necessary to resist the impact.

CC-3230 LOAD COMBINATIONS

(a) Table CC-3230-1 lists the load combinations and applicable load factors for which the containment shall be designed.

(b) The live load shall be considered to vary from zero to full value for all load combinations.

(c) The maximum effects of P_a , T_a , R_a , R_r , and G shall be combined unless a time-history analysis is performed to justify lower combined values.

CC-3240 LOAD DEFINITIONS

CC-3241 Static and Seismic Loads

Static loads are defined as those loads which are considered to remain constant with respect to time or which have a long period of application or rise time relative to the response period of the containment. This category also includes seismic loads for which the dynamic effects have been included in their determination. The following are examples of loads in this category:

- (a) dead load D , live load L , and prestress F ;
- (b) accident pressure P_a ;
- (c) pipe reactions during normal and postulated accident conditions R_o and R_a ;

Page 61

NOTE:

(1) Includes all temporary construction loading during and after construction of containment.

TABLE CC-3230-1 LOAD COMBINATIONS AND LOAD FACTORS

- (d) design wind W , tornado wind pressure W_{tg} , and differential pressure W_{tp} ;
- (e) operating and safe shutdown earthquake, E_o and E_{ss} , except when combined with impulse loading and impact effects.

CC-3242 Impulse Loads

Impulse loads are time dependent and include the following:

- (a) the dynamic effects of accident pressure P_a where rate of loading affects the response of the structure;
- (b) the effects of pipe rupture reactions R_{rr} and jet impingement loading R_{rj} ;
- (c) the dynamic effects of valve actuation G such as steam relief valve or other high energy device actuation effects where rate of loading affects the response of the structure.

CC-3243 Impact Effects

Impact effects are those that can be specified in terms of kinetic energy at impact. These include the impact energies resulting from tornado missiles W_{tm} , pipe rupture generated missiles R_{rm} , and any other specific site-dependent missiles, including the case where a gap exists between the pipe and its structural restraint.

CC-3300 CONTAINMENT DESIGN ANALYSIS PROCEDURES

CC-3310 GENERAL

- (a) Methods of analysis which are based on accepted principles of engineering mechanics and which are appropriate to the geometry of the containment shall

Page 62

be used. In the design of local sections, consideration shall be given to the redistribution of moments and forces in a statically indeterminate structure because of cracking of the concrete, and to the stiffening effect of buttresses or other integral portions of the containment.

- (b) The short-term as well as the long-term foundation soil properties shall be considered. In order to ensure consideration of the critical condition, a range of values of soil constants shall be considered.

- (c) For prestressed containments, the analytical methods selected for construction and normal category load combinations shall account for the creep characteristics and the thick section geometry that is characteristic at ring girders and buttresses.

CC-3320 SHELLS

- (a) Containments are normally thin shell structures. Elastic behavior shall be the accepted basis for predicting internal forces, displacements, and stability of thin shells. Effects of reduction in shear stiffness and tensile membrane stiffness due to cracking of the concrete shall be considered in methods for predicting maximum strains and deformations of the containment. Equilibrium check of internal forces and external loads shall be made to ensure consistency of results.

- (b) Although shell analysis may be based on membrane theory, additional consideration is required for bending and shear forces at penetrations, intersection with base mat, discontinuities, and the stresses and strains caused by temperature variations.

- (c) The stability of the containment shall be verified, giving consideration to the possible reduction in the buckling capacity caused by large deflections, creep effects, and specified construction tolerances.

- (d) Model tests may be used instead of the design analysis if they are conservative and represent the prototype containment.

- (e) Model tests may be used to check the validity of assumptions involved in mathematical analysis.

CC-3330 BASE MAT, FRAMES, BOX TYPE STRUCTURES, AND ASSEMBLIES OF SLABS

Analyses based on elastic behavior, or other methods generally accepted in conventional practice, shall be used. Effects of discontinuities and loading from the foundation soils shall be considered.

CC-3340 PENETRATIONS AND OPENINGS

- (a) Careful attention shall be given to the analysis of the containment in the vicinity of openings. The effect of an opening

on the overall containment shall be considered and the containment shall be thickened around the opening, if necessary, to satisfy allowable stresses and facilitate concrete placement.

(b) The thermal stresses caused by process piping passing through the wall shall be considered.

CC-3400 CONCRETE CONTAINMENT STRUCTURE DESIGN ALLOWABLES

CC-3410 GENERAL

In order to keep the containment basically elastic under service load conditions and below the range of general yield under factored primary loads, the allowable stresses and strains specified in this Subarticle shall be used. The allowable stresses given in CC-3421, CC-3422, CC-3423, CC-3431, CC-3432, and CC-3433 shall not be exceeded when the containment is subjected to the loads given in Table CC-3230-1.

CC-3420 ALLOWABLE STRESS FOR FACTORED LOADS

CC-3421 Concrete

CC-3421.1 Compression.

The allowable stresses for factored compression loads are summarized in Table CC-3421-1. These allowables shall be reduced, if necessary, to maintain structural stability.

CC-3421.2 Tension.

Concrete tensile strength shall not be relied upon to resist flexural and membrane tension.

CC-3421.3 Shear.

If the calculated shear is greater than the allowables given in the following paragraphs, then reinforcement or prestressing forces shall be provided in accordance with CC-3520.

CC-3421.4 Radial Shear.

Radial shear is a transverse shear and is similar to shear in beam analysis. It occurs in the vicinity of discontinuities in shell flexural or membrane behavior. An example of radial shear is the shear caused by self-constraint of a cylinder and base mat during pressurization of the containment. Another example is the shear in the base mat caused by primary vertical forces in structures supported by the mat. A third example is the shear resulting from discontinuity

Page 63

effects which can occur at the perimeter of penetrations or near other concentrated loads. In this example, peripheral shear must also be considered.

TABLE CC-3421-1
ALLOWABLE COMPRESSION STRESSES FOR FACTORED LOADS

Primary		Primary Plus Secondary [Note (1)]	
Membrane	Membrane Plus Bending [Note (2)]	Membrane	Membrane Plus Bending [Note (2)]
$0.60 f'_c$			
	$0.75 f'_c$		
		$0.75 f'_c$	
			$0.85 f'_c$ [Note (3)]

NOTES:

- (1) The primary portion of this calculated stress shall not exceed the allowable stress applicable when primary stress acts alone.
- (2) The membrane portion of this calculated stress shall not exceed the allowable stress applicable when membrane stress acts alone.
- (3) The maximum allowable primary-plus-secondary membrane and bending compressive stress of $0.85 f'_c$ corresponds to a limiting strain of 0.002 in./in.

CC-3421-1 ALLOWABLE COMPRESSION STRESSES FOR FACTORED LOADS

CC-3421.4.1 Reinforced Concrete

(a) The nominal shear stress v_c shall not exceed the lesser of:

$$(1) v_c = 3.5 \sqrt{f'_c}$$

$$(2) v_c = [(1.9 \rho \sqrt{f'_c} / 0.015) + 2500 \rho (V_u d / M_u)]$$

for $\rho < 0.015$, and

$$(3) v_c = 1.9 \sqrt{f'_c} + 2500 \rho (V_u d / M_u)$$

for $\rho \geq 0.015$, where $(V_u d / M_u)$ shall not exceed 1.0.

(b) For sections subjected to membrane compression either Eq. (4) or (5) may be used, but v_c shall not be larger than the value given by Eq. (6):

$$(4) v_c = 1.9 \sqrt{f'_c} + 2500 \rho (V_u d / M')$$

where $M' = M_u - N_u [(4t - d)/8]$ then M' can be less than $V_u d$. If M' is negative, use Eq. (6).

$$(5) v_c = 2(1 + 0.0005 N_u / A_g) \sqrt{f'_c}$$

$$(6) v_c = 3.5 \sqrt{f'_c} \sqrt{1 + 0.002 N_u / A_g}$$

The units for N_u / A_g are psi, and N_u is positive for compression.

(c) For sections subjected to membrane tension, Eq. (7) shall be used with N_u negative for tension:

$$(7) v_c = 2.0 \sqrt{f'_c} (1 + 0.002 N_u / A_g)$$

When $v_u \leq 0.5\sqrt{f'_c}$, v_c may be taken to equal v_u .

CC-3421.4.2 Prestressed Concrete.

The allowable shear stress v_e shall be the lesser of v_{ci} or v_{cw} , as calculated by Eqs. (8) and (9):

Page 64

$$v_{cw} = 3.5\sqrt{f'_c} \sqrt{1 + \frac{f_{pc}}{3.5\sqrt{f'_c}}} \quad (8)$$

$$v_{ci} = K\sqrt{f'_c} + \frac{(M_{cr} - M_i) \frac{V}{M} + V_i}{b'd} \quad (9)$$

(8-9)

For $\rho \geq 0.003$, $K = 1.75 - (0.036/\rho) + 4.0\rho$, but not less than 0.6.

For $\rho < 0.003$, K shall be taken as zero.

$$M_{cr} = (I/y_t) (6\sqrt{f'_c} + f_{pc})$$

and

$$n = 505/\sqrt{f'_c}$$

- (a) Loads shall be applied in their chronological order.
- (b) The loads at a particular time shall be divided into the following two categories:
 - (1) the applied load or loads;
 - (2) those loads existing prior to application of the applied load or loads under consideration.
- (c) If the actual chronological loading order cannot be determined between two or more loads, then the load with the least V/M ratio at the section under consideration shall be applied first.
- (d) If $(M_{cr} - M_i)$ is not positive in sign, then it shall be considered as zero.
- (e) All existing and applied shear loads shall be taken at the section under consideration.
- (f) All moments and other loads affecting the determination of M_{cr} shall be taken at a distance $d/2$ from the section being investigated for shear measured in the direction of decreasing moment.
- (g) If the section under consideration is subjected to membrane tension, then Eq. (7) shall be used in conjunction with Eqs. (8) and (9) with the lowest value of v_c used in the design.

(h) The following definitions shall be used:

V	= the applied shear load at the section under consideration
M	= the applied moment associated with the applied shear load
V_i	= the existing shear loads at the section under consideration (positive if applied in the same direction as V)
M_i	= the existing moments associated with the existing shear loads (positive if applied in the same direction as the applied moments)
M_{cr}	= the moment necessary to cause cracking (always positive)
f_{pc}	= the membrane stress, due to all loads, in the concrete at the centroid of the section where V is applied (positive if compression)
I	= moment of inertia at the distance $d/2$ from the section being investigated for shear, measured in the direction of decreasing moment
y_t	= distance from the centroidal axis of gross section, neglecting the reinforcement, to the extreme fiber in tension
ρ	= A_s/bd , ratio of bonded tension reinforcement

CC-3421.5 Tangential Shear.

Tangential shear is a membrane shear in the plane of the containment shell resulting from lateral load such as earthquake, wind, or tornado loading.

CC-3421.5.1 Reinforced Concrete.

No tangential shear strength shall be considered as provided by the concrete, i.e.,

$$V_c = 0$$

CC-3421.5.2 Prestressed Concrete.

Where a minimum prestress as defined in CC-3521.1.2 is present,

$$V_c = 4\sqrt{f'_c} bt \sqrt{1 + \left[\frac{f_m + f_h}{4\sqrt{f'_c}} \right] + \left[\frac{f_m f_h}{(4\sqrt{f'_c})^2} \right]} \quad (10)$$

(10)

where f_m and f_h are membrane stresses respectively in meridional and hoop directions, compression positive, psi. Thermal membrane stresses shall be included in f_m and f_h

CC-3421.6

CC-3421.6 Peripheral Shear.

Peripheral shear is a transverse shear and is similar to punching shear in slab analysis. It is the shear resulting from a concentrated force or reaction acting transverse to the plane of the wall. An example of peripheral shear is the transverse shear associated with a local concentrated load. Another example of peripheral shear is the transverse shear which can occur at the perimeter of penetrations. In this example, radial shear must also be considered.

(a) The value of v_c shall be calculated as a weighted average of v_{ch} and v_{cm} ; v_{ch} is the allowable shear stress on a failure surface perpendicular to a meridional line, and v_{cm} is the allowable shear stress on a meridional failure surface perpendicular to the plane of the shell. For a circular failure surface, v_c is the average of v_{ch} and v_{cm} .

(b) When the membrane stress f_h or f_m is tensile, the peripheral or punching shear stress taken by the

Page 65

concrete on the assumed failure surface at loaded areas that are circular, square, or rectangular with an aspect ratio β_c less than 2, shall not exceed v_c as obtained in (a) above.

For $f_h/\rho'_h f_y \geq (-0.9)$

$$v_{cm} = \sqrt{f_c} (4 + k_p f_h/\rho'_h f_y)$$

For $f_h/\rho'_h f_y < (-0.9)$

$$v_{cm} = 0.5\sqrt{f_c}$$

and

For $f_m/\rho'_m f_y \geq (-0.9)$

$$v_{ch} = \sqrt{f_c} (4 + k_p f_m/\rho'_m f_y)$$

For $f_m/\rho'_m f_y < (-0.9)$

$$v_{ch} = 0.5\sqrt{f_c}$$

where

f_m	= concrete membrane stress in meridional direction, compression positive, psi
f_h	= concrete membrane stress in hoop direction, compression positive, psi
β_c	= ratio of long side to short side of loaded rectangular area
ρ'_h	= hoop direction reinforcing ratio based on wall thickness t
ρ'_m	= meridional direction reinforcing ratio based on wall thickness t
k_p	= adjustment factor for penetrations = $1 + 2.9d_p/t$ (not to exceed 3.9)
d_p	= average outside diameter of penetration in containment wall
t	= containment wall thickness

When the aspect ratio β_c of the loaded rectangular area is greater than 2, and when v_{cm} or v_{ch} is greater than $0.5\sqrt{f_c}$, the values of v_{cm} or v_{ch} shall be reduced by the factor $(1/2 + 1/\beta_c)$.

(c) Where the membrane stress f_h or f_m is compressive but less than 125 psi, v_{cm} or v_{ch} shall be taken equal to $4\sqrt{f_c}$.

(d) For load conditions where the membrane stress f_h or f_m , as defined above, is at least 125 psi compression, the peripheral or punching shear taken by the concrete on the assumed failure surface shall not exceed v_c as obtained in (a) above:

$$v = 3.5\sqrt{f_c} + 0.3f$$

$$cm \quad c \quad h$$

$$v_{ch} = 3.5\sqrt{f'_c} + 0.3f_m$$

where f'_c shall not be taken as greater than 5000 psi and neither f_h nor f_m shall be taken greater than 500 psi.

CC-3421.6.1 Critical Section.

The failure surface for peripheral shear shall be perpendicular to the surface of the containment and located so that its periphery is at a distance $d/2$ from the periphery of the concentrated load or reaction area, except for impact loads where the critical section is defined in CC-3931.

CC-3421.7 Torsion.

Torsional shear stress is a local, in-plane shear stress produced in the containment wall by a direct external torsional loading applied about an axis normal to the containment wall. In the case of piping penetrations normal to and anchored in the containment wall, the applicable loading is the torsional moment in the penetration. When the penetration is on a skew from the containment wall, the applicable loading is the sum of the components, along an axis normal to the containment, of the internal moments (torsion and bending) in the penetration. Such a loading and anchorage will produce in-plane shear stress in the concrete normal to a radius from the center line of the penetration.

(a) The shear stress carried by the concrete v_{ct} resulting from a torsional loading shall not exceed v_{ct} as calculated from the following equation:

$$v_{ct} = 6\sqrt{f'_c} \sqrt{1 + \frac{f_h + f_m}{6\sqrt{f'_c}} + \frac{f_m f_h}{(6\sqrt{f'_c})^2}} \quad (11)$$

(11)

but need not be taken less than $4\sqrt{f'_c}$.

(b) The torsional shear failure surface shall be a cylindrical surface perpendicular to the surface of the containment and located at a distance r from the center line of the penetration or embedment plate.

Failure surfaces located nearer to the center line than $r_{\min}$ need not be evaluated.

(c) The following definitions shall be used:

r

= the distance measured along a radial line from the center of a containment piping penetration or embedded plate to the failure surface, in.

$r_{\min}$

= the distance measured along a radial line from the center of a containment penetration to the end of penetration anchors attached normal to the penetration wall, or the radial distance from the center line of containment penetration or embedded plate to the center line of the furthest

CC-3421.8 Brackets and Corbels

CC-3421.8.1 General.

These provisions shall apply to brackets and corbels with a shear span-to-depth ratio a/d not greater than unity, and subject to a horizontal tensile force N_{uc} not larger than V_u . Distance d shall be measured at face of support.

CC-3421.8.2 Depth.

Depth at outside edge of bearing area shall not be less than $0.5d$.

CC-3421.8.3 Design.

Section at face of support shall be designed to resist simultaneously a shear V_u , a moment $[V_u a + N_{uc}(h-d)]$, and a horizontal tensile force N_{uc} .

(a) In all design calculations in accordance with these provisions, the nominal shear stress v_u shall be computed as

$$v_u = \frac{V_u}{0.85bd}$$

where V_u is the factored shear force at the section.

(b)(1) Design of shear-friction reinforcement A_{vf} to resist shear V_u shall be in accordance with CC-3424.

(2) The nominal shear stress v_u shall not exceed $0.2f_c$ nor 800 psi (5520 kPa).

(c) Reinforcement A_f to resist moment $[V_u a + N_{uc}(h-d)]$ shall be computed in accordance with CC-3500.

(d) Reinforcement A_n to resist tensile force N_{uc} shall be determined from $N_{uc} \leq 0.85A_n f_y$. Tensile force N_{uc} shall not be taken less than $0.2V_u$ unless special provisions are made to avoid tensile forces. Tensile force N_{uc} shall be regarded as a live load even when tension results from creep, shrinkage, or temperature change.

(e) Area of primary tension reinforcement A_3 shall be made equal to the greater of $(A_f + A_n)$ or $(2A_{vf}/3 + A_n)$.

CC-3421.8.4 Stirrups.

Closed stirrups or ties parallel to A_3 , with a total area A_h not less than $0.5(A_3 - A_n)$, shall be uniformly distributed within two-thirds of the effective depth adjacent to A_3 .

CC-3421.8.5 Reinforcement Ratio.

Ratio $\rho = A_3/bd$ shall not be less than $0.04(f_c/f_y)$.

CC-3421.8.6 Anchorage.

At front face of bracket or corbel, primary tension reinforcement A_3 shall be anchored by one of the following:

- (a) by a structural weld to a transverse bar of at least equal size; weld to be designed to develop specified yield strength f_y of A_3 bars;
- (b) by bending primary tension bars A_3 back to form a horizontal loop; or
- (c) by some other means of positive anchorage.

CC-3421.8.7 Bearing Area.

Bearing area of load on bracket or corbel shall not project beyond straight portion of primary tension bars A_3 , nor project beyond interior face of transverse anchor bar (if one is provided).

CC-3421.9 Bearing.

Bearing stresses shall not exceed $0.6f_c$ except as provided below.

(a) When the supporting surface is wider on all sides than the loaded area or otherwise confined, the permissible bearing stress on the loaded area may be multiplied by $\sqrt{A_2/A_1}$ but not by more than 2.

(b) When the supporting surface is sloped or stepped, A_2 may be taken as the area of the lower base of the largest frustum of a right pyramid or cone contained wholly within the support and having for its upper base the loaded area, and having side slopes of one vertical to two horizontal.

(c) This Subsection does not apply to post-tensioning anchorages.

CC-3422 Reinforcing Steel

CC-3422.1 Tension

(a) The design yield strength of reinforcement shall not exceed 60,000 psi (410 MPa).

(b) The allowable stress for load resisting purposes shall not exceed $0.9f_y$.

(c) Under the primary forces only, the tensile strain in reinforcement resisting membrane and flexural components of the local section forces (but not the strain in reinforcement resisting local section shear forces) may exceed $0.9\epsilon_y$, provided a sufficient number of reinforcement bars remains below $0.9\epsilon_y$, such that attainment of a general yield state is precluded with respect to any components of curvature. Reinforcement may be permitted to exceed $0.9\epsilon_y$ under the effects of primary forces for the following conditions only.

(1) *Primary Bending Moment.* If more than one layer of reinforcement is provided to resist primary bending moments, one or more layers of reinforcement may be permitted to exceed $0.9\epsilon_y$, provided the strain at the centroid of all bars more than $h/6$ from the center of the concrete section on the maximum tension side of the section shall not exceed $0.9\epsilon_y$.

(2) *Tension Diagonal Reinforcement.* The strain in a tension diagonal reinforcement of a four-way

Page 67

reinforcement system to primary forces may exceed $0.9\epsilon_y$. To avoid the possible buckling of compression diagonal reinforcement, either the diagonal reinforcement shall be enclosed by at least one layer of hoop reinforcement or the tension and compression diagonal reinforcement shall be tied at their intersections.

(3) *Adjacent to Large Openings.* The maximum strain in reinforcement adjacent to large openings may exceed $0.9\epsilon_y$, provided that, when a section of width one-half nominal containment shell thickness h extending from the opening or 25% of the opening diameter, whichever is smaller, is analyzed for the total forces and moments assumed uniformly distributed over the section width, no reinforcement strain shall exceed $0.9\epsilon_y$.

distributed over the section width, no reinforcement strain shall exceed $0.9\epsilon_y$.

(d) Under combined primary and secondary forces, the tensile strain in reinforcement may exceed $0.9\epsilon_y$.

(e) Calculated tensile strains in any reinforcement due to primary forces and the major principal membrane strain due to primary forces shall not exceed $2\epsilon_y$. For analysis purposes, ϵ_y is defined as the yield stress divided by Young's modulus.

CC-3422.2 Compression

(a) For load resisting purposes, the stress shall not exceed $0.9f_y$.

(b) The strains may exceed yield when acting in conjunction with the concrete if the concrete requires strains larger than the reinforcing yield to develop its capacity.

CC-3423 Tendon System Stresses

The axial tensile capacity of the tendon shall not be taken as greater than $0.9f_{py}$.

CC-3424 Shear Friction

CC-3424.1 General.

The provisions of CC-3424 shall apply to brackets and corbels designed in accordance with CC-3421.8.

CC-3424.2 Crack Location.

A crack shall be assumed to occur along the shear plane considered. Required area of shear-friction reinforcement A_{vf} across the shear plane may be designed using either CC-3424.3 or any other shear transfer design methods that result in prediction of strength in substantial agreement with results of comprehensive tests.

CC-3424.3 Shear-Friction Design Method

CC-3424.3.1

When shear-friction reinforcement is perpendicular to shear plane, the area of reinforcement required shall be computed by

$$A_{vf} = \frac{V_u}{0.85\mu f_y}$$

where μ is the coefficient of friction in accordance with CC-3424.3.3 and V is the factored shear force at section.

CC-3424.3.2

When shear-friction reinforcement is inclined to shear plane, such that the shear force produces tension in shear-friction reinforcement, the area of reinforcement required shall be computed by

$$A_{vf} = \frac{V_u}{0.85 f_y (\mu \sin \alpha_f + \cos \alpha_f)}$$

where α_f is the angle between shear-friction reinforcement and shear plane. This equation is not valid if α_f is greater than 90 deg.

CC-3424.3.3

Coefficient of friction μ in CC-3424.3.1 and CC-3424.3.2 shall be:

- (a) 1.4 for concrete placed monolithically;
- (b) 1.0 for concrete placed against hardened concrete with surface intentionally roughened as specified in CC-3424.8;
- (c) 0.6 for concrete placed against hardened concrete not intentionally roughened;
- (d) 0.7 for concrete anchored to as-rolled structural steel by headed studs or by reinforcing bars (see CC-3424.9).

CC-3424.4 Maximum Shear.

The shear friction provisions of CC-3424 are not applicable if the nominal shear stress v_u exceeds $0.2f_c$ or 800 psi (5520 kPa).

CC-3424.5 Strength of Reinforcement.

Design yield strength of shear-friction reinforcement shall not exceed 60,000 psi (410 MPa).

CC-3424.6 Tension.

Net tension across shear plane shall be resisted by additional reinforcement. Permanent net compression across shear plane may be taken as additive to the force in the shear-friction reinforcement A_{vf} when calculating required A_{vf} .

CC-3424.7 Anchorage.

Shear-friction reinforcement shall be appropriately placed along the shear plane and shall be anchored to develop the specified yield strength on both sides by embedment, hooks, or welding to special devices.

CC-3424.8 Concrete-to-Concrete Interface.

For the purpose of CC-3424, when concrete is placed against previously hardened concrete, the interface for shear transfer shall be clean and free of laitance. If μ is

assumed equal to 1.0, the construction specification shall include requirements for roughening and cleaning the hardened surface.

CC-3424.9 Concrete-to-Steel Interface.

When shear is transferred between as-rolled steel and concrete using headed studs or welded reinforcing bars, steel shall be clean and free of paint.

CC-3430 ALLOWABLE STRESSES FOR SERVICE LOADS

CC-3431 Concrete Stresses

CC-3431.1 Compression.

The allowable stresses for service compression loads are summarized in Table CC-3431-1. Compression under the tendon end anchor bearing plates shall not exceed $0.6f_{ci}(A_2/A_1)^{1/3}$. The compression stress shall be calculated by dividing the initial tendon force at anchoring by the net area of the bearing plate, but shall not be greater than f_{ci} . These allowables shall be reduced, if necessary, to maintain the structural stability.

CC-3431.2 Tension.

Concrete tensile strength (membrane and flexure) shall not be relied upon to resist the external loads and moments or the forces and moments resulting from internal self-constraint.

CC-3431.3 Shear, Torsion, and Bearing

(a) The allowable concrete stresses and the limiting maximum stresses for shear, torsion, and bearing shall be 50% of the values given for factored loads in CC-3421.3 through CC-3421.9, except as follows.

(1) In CC-3421.4.1(c) and CC-3421.6(b), the allowable concrete stress need not be reduced below $0.5\sqrt{f_c}$.

(2) The allowable concrete stress shall be 67% of the values given for factored loads in load combinations that include the temporary pressure loads during the test condition or the temporary loads from prestressing which will decrease at completion of prestressing.

(3) The allowable concrete stress shall be 67% of the values given for factored loads when secondary forces, defined in Table CC-3136.6-1, are combined with other forces, provided the section thus required is not less than that required for the combination of other loads in the loading combination.

(b) The computed membrane stress on the gross section resulting from service loads shall be multiplied by 2 and substituted for N_u/A_g , f_m , F_p , or f_{pc} in invoking the provisions of CC-3421.4.1, CC-3421.4.2, CC-3421.6, and CC-3421.7, except in those instances listed in (a) above, where 67% of the values given for factored loads is specified, in which case a 1.5 multiplier shall be used.

(c) Reinforcement requirements for brackets and corbels shall be computed using a factor of $0.5f_y$ instead of the $0.85f_y$ given in CC-3421.8 and CC-3424.

CC-3432 Reinforcing Steel Stresses and Strains

CC-3432.1 Bar Tension

(a) The average tensile stress shall not exceed $0.5f_y$.

(b) The calculated average stress for the reinforcing in zones which have predicted concrete tension due to prestressing loads shall not exceed $0.5f_y$. The maximum load considered need not exceed the initial force at tendon anchoring. The values given in (a) above may be increased by $33\frac{1}{3}\%$ when the following loads are combined with other loads in the load combination:

- (1) the temporary loads from prestressing which will reduce at completion of prestressing;
- (2) when secondary forces, defined in Table CC-3136.6-1, are combined with other forces, provided the section thus required is not less than that required for the combination of other loads in the loading combination.
- (c) The values given in (a) above may be increased by 50% when the temporary pressure loads during the test condition are combined with other loads in the load combination.

CC-3432.2 Bar Compression

- (a) For load resisting purposes, the stress shall not exceed $0.5f_y$.
- (b) The stress may exceed that given in (a) above for compatibility with the concrete but this stress may not be used for load resistance.
- (c) The values given in (a) above may be increased by $33\frac{1}{3}\%$ when the following loads are combined with other loads in the load combination:
- (1) the temporary loads from prestressing which will be reduced at completion of prestressing;
- (2) the temporary pressure loads during the test condition;
- (3) when secondary forces, defined in Table CC-3136.6-1, are combined with other forces, provided the section thus required is not less than that required for the combination of other loads in the loading combination.

CC-3433 Tendon System Stresses

The tendon stresses during stressing and anchoring, and the tendon stresses used for design shall not exceed the following allowables.

- NOTES:
- (1) The primary portion of this calculated stress shall not exceed the allowable stress applicable when primary stress acts alone.
- (2) These allowable stresses may be increased by $0.05f'_c$ for sections with radial tension reinforcement.
- (3) At initial prestress.
- (4) The membrane portion of this calculated stress shall not exceed the allowable stress applicable when membrane stress acts alone.

TABLE CC-3431-1 ALLOWABLE COMPRESSION STRESSES FOR SERVICE LOADS

- (a) During stressing, the tension stress at the anchor point shall not exceed $0.80f_{pu}$ or $0.94f_{py}$, whichever is less.
- (b) Immediately after anchoring, the tension stress at the anchor point shall not exceed $0.73f_{pu}$ and the calculated average tension stress over the length of the tendon shall not exceed $0.70f_{pu}$.
- (c) For the purpose of design, the effective prestress shall be based on tendon stresses not exceeding those calculated to occur immediately after anchoring minus all applicable losses defined in CC-3542.

CC-3440 CONCRETE TEMPERATURES

- (a) The following temperature limitations are for normal operation or any other long-term period. The temperatures shall not exceed 150°F (66°C) except for

Page 70

local areas, such as around a penetration, which are allowed to have increased temperatures not to exceed 200°F (93°C).

- (b) The following temperature limitations are for accident or any other short-term period. The temperatures shall not exceed 350°F (177°C) for the interior surface. However, local areas are allowed to reach 650°F (343°C) from steam or water jets in the event of a pipe failure.

- (c) Higher temperatures than given in (a) and (b) above may be allowed in the concrete if tests are provided to evaluate the reduction in strength and this reduction is applied to the design allowables. Also, evidence shall be provided which verifies that the increased temperatures do not cause deterioration of the concrete either with or without load.

CC-3500 CONTAINMENT DESIGN DETAILS

CC-3510 DESIGN FOR FLEXURE AND AXIAL LOADS

CC-3511 Assumptions

CC-3511.1 Factored Load Design

- (a) The design of sections for flexure and membrane loads shall be based on the assumptions given in this paragraph and on satisfaction of the applicable conditions of equilibrium and compatibility of strains.

- (b) Strain in the reinforcing steel and concrete shall be assumed directly proportional to the distance from the neutral axis.

- (c) Stress in reinforcement below 0.9 of the specified yield strength for the grade of steel used shall be taken as E_s times the steel strain. For strains greater than that corresponding to $0.9f_y$, the stress in the reinforcement shall be considered independent of strain and equal to $0.9f_y$.

- (d) Tensile strength of the concrete shall be neglected in flexural calculations of reinforced concrete.

- (e) The relationship between the concrete compressive stress distribution and the concrete strain used in the analysis of sections may be assumed to be a triangle, parabola, or any other shape which results in prediction of stress and strains in substantial agreement with the results of comprehensive tests. The stresses determined shall be compared to the stress limits of CC-3420 to ensure design adequacy.

CC-3511.2 Service Load Design.

The straight line theory of stress and strain shall be used and the following assumptions shall be made.

- (a) A section plane before bending remains plane after bending; strains vary as the distance from the neutral axis.
- (b) The stress-strain relation for concrete is a straight line under service loads within the allowable stresses; stresses vary as the distance from the neutral axis.
- (c)

(c) Tensile stress of the concrete shall be neglected in flexural calculations of reinforced concrete.

(d) The modular ratio, $n = E_s / E_c$, may be taken as the nearest whole number but not less than 6. In doubly reinforced members, an effective modular ratio of $2E_s / E_c$ may be used to transform the compression reinforcement for stress computations.

CC-3520 DESIGN OF SHEAR REINFORCEMENT

CC-3521 Factored Load Design

CC-3521.1 Tangential Shear and Membrane Forces

CC-3521.1.1 Reinforced Concrete

(a) Required area of orthogonal (hoop and meridional) reinforcement, with or without inclined reinforcement, provided for combined tangential shear and membrane strength shall be computed by:

$$A_{sh} + A_{si} = \frac{N_h + (N_h \ell^2 + V_u^2)^{1/2}}{0.9f_y} \quad (12)$$

$$A_{sm} + A_{si} = \frac{N_m + (N_m \ell^2 + V_u^2)^{1/2}}{0.9f_y} \quad (13)$$

(12-13)

(b) Any combination of orthogonal and inclined reinforcement as required for strength according to Eqs. (12) and (13), and as required to control shear deformations may be used with the following limits on maximum shear force.

(1) Tangential shear strength provided by orthogonal reinforcement V_{so} and computed by

$$(14) V_{so} = V_u - 0.9f_y A_{si}$$

shall not be greater than $0.2f_c b \ell$.

(2) Tangential shear force V_u shall not exceed $(0.4f_c b \ell - V_{so})$ where V_{so} is computed according to Eq. (14)

where

A_{sh}	= area of bonded reinforcement in the hoop direction (in. ² /ft)
A_{sm}	= area of bonded reinforcement in the meridional direction (in. ² /ft)
A_{si}	= area of bonded reinforcement in one direction of inclined bars at 45 deg. to horizontal (in. ² /ft along a line perpendicular to the direction of the bars). Inclined reinforcement shall be provided in both directions.

Page 71

N_h and N_m

= membrane force in the hoop and meridional direction respectively due to pressure, prestress, and dead load. The prestress force shall be the effective value. N_h and N_m are positive when tension and negative when compression.

N_h and $N_{m,ell}$

= membrane force in the hoop and meridional direction, respectively, from lateral load such as earthquake, wind, or tornado loading. When considering earthquake loading, this force is based on the square root of the sum of the squares of the components of the two horizontal and vertical earthquakes. The force is always considered as positive.

V_c

= tangential shear strength provided by concrete

V_{si}

= tangential shear strength provided by inclined reinforcement

V_{so}

= tangential shear strength provided by orthogonal reinforcement

V_u

= the peak membrane tangential shear force resulting from lateral load such as earthquake, wind, or tornado loading. When considering earthquake loading, this force is based on the square root of the sum of the squares of the components of the two horizontal and vertical earthquakes. The shear force shall be considered as positive.

All forces and strengths are expressed in kips/ft.

The strain compatibility of the concrete and reinforcement shall be checked to ensure that the strain allowables in CC-3422 are not exceeded for orthogonal and inclined reinforcement.

CC-3521.1.2 Prestressed Concrete

(a) A sufficient amount of effective prestress shall be provided so that N_h and N_m are either negative (compression) or zero. Thermal membrane forces shall be included in N_h and N_m for the calculation of effective prestress.

(b) No additional reinforcement is required for tangential shear forces if

$$(15) V_u \leq 0.85 V_c$$

where V_c is calculated according to CC-3421.5.2.

(c) When the section under consideration does not meet the requirements of either CC-3521.1.2 (a) or (b), additional reinforcement shall be provided according to requirements of CC-3521.1.1.

CC-3521.2 Radial Shear

CC-3521.2.1 Nominal Shear Stress.

The nominal shear stress v_u shall be computed by

$$(16) v_u = V_u / 0.85bd$$

where d need not be less than $0.85h$ for prestressed members.

CC-3521.2.2 Applied Shear Stress.

When the reaction, in the direction of applied shear, introduces compression into the end region of the containment, sections located less than a distance d from the face of the support may be designed for the same v_u as that computed at a distance d . For prestressed concrete, sections located at a distance less than $t/2$ may be designed for the shear computed at $t/2$.

CC-3521.2.3 Shear Reinforcement

(a) When shear reinforcement perpendicular to the containment surface is used, the required area of shear reinforcement shall not be less than

$$(17) A_v = (v_u - v_c)bs/f_y$$

The perpendicular shear reinforcement shall not be spaced further apart than $0.50d$.

(b) When inclined stirrups or bent bars are used as shear reinforcement in reinforced concrete members, the following provisions apply.

(1) When inclined stirrups are used, the required area shall not be less than

$$A_v = \frac{(v_u - v_c)bs}{f_y(\sin \alpha + \cos \alpha)} \quad (18)$$

(18)

(2) When shear reinforcement consists of a single bar or a single group of parallel bars, all bent at the same distance from the support, the required area shall be not less than

Page 72

$$A_v = \frac{(v_u - v_c)bd}{f_y \sin \alpha} \quad (19)$$

(19)

in which $(v_u - v_c)$ shall not exceed $3\sqrt{f'_c}$.

(3) When shear reinforcement consists of a series of parallel bent bars or groups of parallel bent bars at different distances from the support, the required area shall be not less than that computed by Eq. (19).

(c) Only the center three-fourths of the inclined portion of any bar that is bent shall be considered effective for shear reinforcement.

(d) Where more than one type of shear reinforcement is used to reinforce the same portion of the section, the required area shall be computed as the sum for the various types separately. In such computations, v_c shall be included only once.

(e) Inclined stirrups and bent bars shall be so spaced that every 45 deg. line extending toward the reaction from the

mid-depth of the section, $0.50d$, to the tension bars shall be crossed by at least one line of shear reinforcement. (f) The value of $(v_u - v_c)$ shall not exceed $8\sqrt{f'_c}$.

CC-3521.3 Peripheral Shear.

Shear stress shall be investigated at the critical section and at successive sections more distant from the critical section in accordance with the following rules.

(a) The nominal shear stress v_u shall be calculated by

$$v_u = V_u / 0.85bd$$

where V_u and b are taken at the critical section specified in CC-3421.6.1.

(b) Shear stress v_c shall be calculated in accordance with CC-3421.6. When v_u is less than v_c and membrane steel stresses are not greater than $0.6f_y$, no additional reinforcing is required.

(c) When v_u is less than v_c and either of the membrane steel stresses exceeds $0.6f_y$, the corresponding meridional or hoop reinforcement shall be designed to resist 1.0 times the shear force corresponding to v_u in addition to any membrane forces and in-plane shear forces. These forces shall be considered as additional membrane forces.

(d) When v_u is greater than v_c , the excess shear force corresponding to $(v_u - v_c)$ shall be resisted by shear reinforcement designed in accordance with CC-3521.2.3. $(v_u - v_c)$ shall be determined as follows.

(1) v_u shall not exceed the greater of $6\sqrt{f'_c}$ or $1.5v_c$ where v_c is calculated in accordance with CC-3421.6.

(2) The shear stress v_c carried by the concrete at any section shall not exceed the greater of $\sqrt{f'_c}$ or $1/2v_c$ when v_c calculated in accordance with CC-3421.6, is greater than or equal to $\sqrt{f'_c}$. When v_c is less than $\sqrt{f'_c}$, the value of v_c calculated in accordance with CC-3421.6, shall be used.

CC-3521.4 Torsional Shear.

Torsional shear stress shall be investigated at the section where $r = r_{\min}$ and at successive surfaces more distant until v_{ut} , as defined below, is equal to or less than v_{ct} as defined in CC-3421.7(a).

(a) The nominal torsional shear stress shall be calculated by:

$$v_{ut} = \frac{T_u}{0.85t(2\pi r^2)} \quad (20)$$

(20)

where T_u = the maximum factored torsional loading applied to the containment wall.

(b) When v_{ut} is less than or equal to v_{ct} no reinforcing is required.

(c) Where v_{ut} is greater than v_{ct} the entire shear stress shall be resisted by reinforcing that which is within the plane of the wall and normal to the failure surface. Such reinforcing shall be designed by the following equation:

$$A_{vt} = \frac{v_{ut}(2\pi\tau)t}{(f_y)\mu} \quad (21)$$

(21)

where

t

= concrete thickness

μ

= a coefficient of friction that shall be taken equal to 1.0 when the failure surface is concrete to concrete and 0.7 when the failure surface is concrete to steel

(d) A_{vt} (in.²) shall be distributed uniformly around the failure surface and shall be fully developed by embedment or mechanical means on either side of the failure surface. Uniformly distributed shall be taken as requiring at least eight approximately equally spaced bars crossing the failure surface.

(e) v_{ut} shall not exceed $0.2f_c$ nor 800 psi (5520 kPa).

CC-3522 Service Load Design

The same requirements stated in CC-3521 shall be used in designing shear reinforcement for service loads with the following modifications.

(a) Equation (17) shall be replaced by $v = V/bd$.

Page 73

(b) The reinforcement steel stress allowable from CC-3432.1 shall replace f_y in Eqs. (18) to (20).

(c) The reinforcing steel stress allowable from CC-3432.1 shall replace $0.9f_y$ in Eqs. (12) to (14).

(d) V_u in Eqs. (12) to (14) shall be replaced by V .

(e) The maximum tangential shear stress provided by orthogonal reinforcement and limiting maximum tangential shear stresses shall be 50% of the values given for factored loads in CC-3521.1.1(b).

(f) Equation (15) in CC-3521.1.2(b) shall be replaced by $V\sqrt{0.5V_c}$.

(g) The requirements of CC-3521.3 shall be used for peripheral shear design for service loads with the following modifications.

(1) The nominal shear stress shall be calculated by $v = V/bd$.

(2) Shear stress v_c shall be calculated in accordance with CC-3431.3.

(3) When v is greater than v_c , the excess shear force corresponding to $(v - v_c)$ shall be resisted by shear reinforcement designed in accordance with (b) above. $(v - v_c)$ shall be determined as follows.

- (a) v shall not exceed the greater of $3\sqrt{f'_c}$ or $1.5v_c$ when v_c is calculated in accordance with CC-3431.3.
- (b) The shear stress v_c carried by the concrete at any section shall not exceed the greater of $\sqrt{f'_c}$ or $1/2v_c$ when v_c calculated in accordance with CC-3431.3, is greater than or equal to $\sqrt{f'_c}$. When v_c is less than $\sqrt{f'_c}$, the value of v_c calculated in accordance with CC-3431.3, shall be used.
- (h) Torsional shear provisions for Service Load Design shall be as follows.
 - (1) In Eq. (21), v_t and T shall be substituted for v_{ut} and T_u , respectively.
 - (2) In Eq. (22), v_t shall be substituted for v_{ut} .
 - (3) v_{ct} shall be calculated in accordance with CC-3431.3.
 - (4) The reinforcement steel stress allowable from CC-3432.1 shall replace f_y in Eq. (22).
 - (5) The limits on v_t shall be calculated in accordance with CC-3431.3 with the values for factored loads being those given in CC-3521.4.

CC-3530 REINFORCING STEEL REQUIREMENTS

CC-3531 General

The following requirements shall govern design of the reinforcing steel.

- (a) The reinforcing steel shall be designed with consideration of placement tolerances specified herein and in the Construction Specification.
- (b) The following paragraphs relate to all load combinations in Table CC-3230-1.

CC-3532 Reinforcing Steel Splicing and Development

- (a) Splices of reinforcement shall be made only as required or permitted on the Design Drawings or in the Construction Specification.
- (b) Lap splices shall not be used for bars larger than No. 11. Lap splices of bundled bars shall be based on the lap splice length required for individual bars of the same size as the bars spliced. The length of lap, as prescribed in CC-3532.1 and CC-3532.2, shall be increased 20% for a 3-bar bundle and 33% for a 4-bar bundle. Bars spliced by noncontact lap splices in flexural members shall not be spaced transversely farther apart than one-fifth the required length of lap nor more than 6 in.
- (c) Where a non-prestressed reinforcement bar splice must be located in a region where tension is predicted in a direction perpendicular to the bar to be spliced, only a positive mechanical splice or a welded butt splice shall be used, unless calculations or tests of the selected splice detail are made to demonstrate that there is an adequate transfer of force. These provisions do not apply to nominal temperature reinforcement.
- (d) Butt splices may be welded or mechanical and shall develop a tensile strength of at least 125% of the specified minimum yield strength of the bar.

CC-3532.1 Tension Splices

CC-3532.1.1 Classification of Tension Lap Splices

- (a) The minimum length of lap for tension lap splices shall be as follows:

Class A splices $1.0l_d$

Class B splices $1.3l_d$

Class C splices $1.7l_d$

The tensile development length l_d for full f_y is as given in CC-3532.1.2.

CC-3532.1.2 Development Length

(a) Reinforcing steel which must terminate in a location where biaxial tension is predicted, such as at penetrations, shall be anchored by hooks, bends, or by positive mechanical anchorage in such a manner that the force in the terminated bar is adequately transferred to other reinforcement. Bar development lengths at such locations shall be increased by at least 25% over those

Page 74

permitted for uniaxial tension. Mechanical devices for end anchorage shall be capable of developing at least 125% of the specified minimum yield strength of the bar. These special precautions are not required for nominal temperature reinforcement.

(b) Where bars no longer required to carry load are terminated in areas of biaxial tension, the bar development lengths shall be increased at least 25% over that required for areas of uniaxial tension, provided that biaxial tension forces are carried by other reinforcement. This requirement does not apply to nominal temperature reinforcement.

(c) The calculated tension in the reinforcement at each section shall be developed on each side of that section by embedment length or end anchorage or a combination thereof. For bars in tension, hooks may be used in developing the bars. If mechanical devices are used in whole or in part for end anchorage, the system shall be capable of developing at least 125% the specified minimum yield strength of the bar.

(d) Tension reinforcement may be anchored by bending it across the section and either making it continuous with the reinforcement on the opposite face of the section, or anchoring it there by any mechanical device capable of developing the required strength of reinforcement.

(e) The critical sections for development of reinforcement are at points of maximum stress and at points where adjacent reinforcement terminates or is bent.

(f) Reinforcement shall extend beyond the point at which it is no longer required to resist flexure for a distance equal to the effective depth of the section or 12 bar diameters, whichever is greater. The extension need not exceed 5 ft (1.5 m) if shear reinforcement is provided in the same area.

(g) Continuing reinforcement shall have an embedment length not less than the development length l_d beyond the point where bent or terminated reinforcement is no longer required to resist flexure or tension.

(h) Reinforcement shall not be terminated in a tension zone unless one of the following conditions is satisfied.

(1) The shear at the cutoff point shall not exceed two-thirds that permitted, including the shear strength of furnished radial reinforcement.

(2) Stirrup area in excess of that required for shear and torsion is provided along each terminated bar over a distance from the termination point equal to three-fourths the effective depth of the member. The excess stirrups shall be proportioned such that $(A_v/b_w s)f_y$ is not less than 60 psi (414 kPa). The resulting spacings shall not exceed $d/(8\beta_p)$, where β_p is the ratio of the area of bars cut off to the total area of bars at the section.

(3) For No. 11 and smaller bars, the continuing bars provide double the area required for flexure at the cutoff point and the shear does not exceed three-fourths that permitted.

(i) The development length l_d in inches, shall be computed as the product of the basic development length of (1) below and the applicable modification factor or factors of (2) below, but l_d shall be not less than 12 in.

(1) The basic development length shall be as follows:

For No. 11 or smaller bars

$$0.04 A_b f_y / \sqrt{f'_c}$$

but not less than

$$0.0004 d_b f_y$$

For No. 14 bars

-

$$0.085f_y/\sqrt{f'_c}$$

For No. 18 bars

$$0.11f_y/\sqrt{f'_c}$$

(2) For horizontal reinforcement, the basic development length shall be multiplied by the factor specified herein if more than 12 in. (305 mm) of concrete is placed below the reinforcement during the concrete placement that embeds the reinforcement in the section. For the purpose of these requirements, reinforcement is considered to be horizontal if the angle the reinforcement makes with the horizontal plane is 30 deg. or less. The multiplying factor shall be equal to 1.4 if more than 36 in. (914 mm) of concrete is placed below the reinforcement. A multiplying factor may be used which decreases linearly from 1.2 to 1.0 as the height of the concrete placed below the reinforcement decreases from 36 in. to 12 in. (914 mm to 305 mm).

(3) The basic development length, modified by the requirements of (2) above, may be multiplied by 0.8 for reinforcement being developed in length under consideration and spaced laterally at least 6 in. (152 mm) on center with at least 3 in. (76 mm) clear from face of member to edge bar measured in the direction of spacing.

(4) The basic development length may be reduced by the ratio of (area required)/(area provided).

Page 75

CC-3532.1.3 Splices in Region of Maximum Tensile Stress.

Splices in regions of maximum tensile stress should be avoided. Where such splices must be used, they shall be butt spliced in accordance with CC-3532(d) or lap spliced in accordance with CC-3532.1.1, as follows:

- (a) if no more than one-half of the bars are lap spliced within a required lap length - Class B;
- (b) if more than one-half of the bars are lap spliced within a required lap length - Class C.

CC-3532.1.4 Splices Away From Regions of Maximum Tensile Stress.

Splices away from regions of maximum tensile stress (maximum computed stress less than $0.5f_y$) shall be butt spliced in accordance with CC-3532(d) or lap spliced in accordance with CC-3532.1 as follows:

- (a) if no more than three-fourths of the bars are lap spliced within a required lap length - Class A;
- (b) if more than three-fourths of the bars are lap spliced within a required lap length - Class B.

CC-3532.1.5 Splices in Tension Tie Members.

Splices shall be made with a welded butt splice or a positive mechanical connection in accordance with CC-3532(d) and be staggered at least $1.7l_d$.

CC-3532.2 Compression Splices

CC-3532.2.1 General.

Splices in compression may be lap or butt spliced. Lap splices shall meet the requirements of CC-3532.2.2 and butt splices shall meet the requirements of CC-3532(d).

CC-3532.2.2 Lap Splices.

The minimum length of a lap splice in compression shall be the development length in compression l_d in accordance with CC-3532.2.3 but not less, in inches, than $0.0005f_y d_b$ for f_y of 60.0 ksi or less.

CC-3532.2.3 Development Length for Bars in Compression

(a) The calculated compression in the reinforcement at each section shall be developed on each side of that section by embedment length or end anchorage or a combination thereof.

(b) The development length l_d for bars in compression shall be computed as $0.02f_y d_b / \sqrt{f_c}$ but shall be not less than $0.0003f_y d_b$ or 8 in. l_d may be modified by a reduction factor equal to (as required)/(as provided).

(c) Hooks shall not be considered effective in developing bars in compression.

CC-3532.3 Development of Standard Hooks in Tension

(a) Development length.. $_{dl}$ in inches, for deformed bars in tension terminating in a standard hook (CC-4321) shall be computed as the product of the basic development length.. $_{hb}$ of (b) below and the applicable modification factor or factors of (c) below, but.. $_{dh}$ shall not be less than $8d_b$ or 6 in. (152 mm), whichever is greater.

(b) Basic development length; $_{ell_{hb}}$ for a hooked bar with f_y equal to 60,000 psi (410 MPa) shall be $1200 d_b / \sqrt{f_c}$ constant carries unit of lb/in.²

(c) Basic development length.. $_{hb}$ shall be multiplied by applicable factor or factors for:

(1) *Bar Yield Strength.* Bars with f_y other than 60,000 psi - $f_y/60,000$;

(2) *Concrete Cover.* For #11 bar and smaller, side cover (normal to plane of hook) not less than $2\frac{1}{2}$ in. (64 mm), and for 90 deg. hook, cover on bar extension beyond hook not less than 2 in. (51 mm) - 0.7;

(3) *Ties or Stirrups.* For #11 bar and smaller, hook enclosed vertically or horizontally within ties or stirrup ties spaced along the full development length.. $_{dh}$ not greater than $3d_b$ where d_b is diameter of hooked bar - 0.8;

(4) *Excess Reinforcement.* Where anchorage or development for f_y is not specifically required, reinforcement in excess of that required by analysis - (A_s required) (A_s provided).

(d) For bars being developed by a standard hook at discontinuous ends of members with both side cover and top (or bottom) cover over hook less than $2\frac{1}{2}$ in., hooked bar shall be enclosed within ties or stirrup ties spaced along the full development length.. $_{dh}$ not greater than $3d_b$ where d_b is diameter of hooked bar. For this case, factor of (c)(3) above shall not apply.

(e) *Notation*

d_b

= nominal diameter of bar, in.

.. $_{dh}$

= development length of standard hook in tension, measured from critical section to outside end of hook [straight embedment length between critical section and start of hook (point of tangency) plus radius of bend and one bar diameter], in.

=.. $_{hb}$ × applicable modification factors

.. $_{hb}$

= basic development length of standard hook in tension, in.

CC-3533 Reinforcing Steel Anchorage

CC-3533.1 Anchorage of Radial Shear Reinforcement

(a) Radial shear reinforcement shall be carried as close to the compression and tension surfaces of the

Page 76

section as cover requirements and the proximity of other steel will permit. The ends shall be anchored by one of the following means:

(1) a standard hook plus an effective embedment of $0.5l_d$; the effective embedment of a stirrup leg shall be taken as the distance between the mid-depth of the member $d/2$ and the start of the hook (point of tangency);

(2) embedment on the compression side of mid-depth $d/2$ for a full-development length l_d but not less than 24 bar diameters;

(3) bending around the membrane reinforcement through at least 135 deg.; hooking or bending stirrups around the membrane reinforcement shall be considered effective anchorage;

(4) any mechanical device capable of developing the required strength of reinforcement.

(b) Between the anchored ends, each bend in the continuous portion of a transverse simple U- or multiple U-stirrup shall enclose a longitudinal bar.

(c) Bars bent to act as section reinforcement shall, in a region of tension, be continuous with the main reinforcement and in a compression zone shall be anchored on the compression side of mid-depth as specified for development length in CC-3532.2.3 for that part of f_y which is needed to satisfy Eq. (19).

(d) Pairs of U-stirrups so placed as to form a closed tie shall be considered properly spliced when the laps are each $1.7l_d$.

CC-3534 Reinforcing Steel Cover and Spacing Requirements

CC-3534.1 Cover

(a) The following minimum concrete cover shall be provided for reinforcing bars, prestressing tendons, or ducts:

	Minimum Cover, in.
Cast against and permanently exposed to earth	3
Exposed to earth or weather:	
No. 6 through No. 18 bars	2
No. 5 bars, $\frac{5}{8}$ in. wire and smaller	$1\frac{1}{2}$
Not exposed to weather or in contact with the ground:	
Principal reinforcement, ties, and stirrups	$1\frac{1}{2}$
Other reinforcement	1

For bar bundles, the minimum cover shall equal the equivalent diameter of the bundle but need not be more than 2 in. (51 mm) or the tabulated minimum, whichever is greater.

(b) The concrete cover shall be established by considering the placing tolerances of the formwork and reinforcement. The minimum concrete cover specified in (a) above shall not be reduced by the placing tolerances of the formwork and reinforcement.

CC-3534.2 Spacing.

The clear distance between parallel bars in a layer shall not be less than the nominal diameter of the bars, nor $1\frac{1}{3}$ times the maximum size of the coarse aggregate, nor 1 in. (25 mm). The clear distance between parallel layers shall not be less than $1\frac{3}{8}$ in. (35 mm). The clear distance limitation between bars shall also apply to the clear distance between a contact (lap) splice and adjacent splices or bars.

CC-3535 Concrete Crack Control

(a) When an expected crack formation is so located that critical elements of the containment, such as anchor zone concrete, buttresses, ring girders, and large opening edges, may be weakened, bonded nonprestressed reinforcement shall be provided to carry the total tensile force in the concrete.

(b) Nonprestressed reinforcement shall be provided in the containment shell to control surface and membrane cracking from the effects of shrinkage, temperature, and membrane tension. The area of such reinforcement in each direction at each face of the concrete shall be a minimum of 0.0020 times the gross cross-sectional area of the section. This requirement may be met in whole or in part by reinforcement otherwise required to resist calculated loads. An integral steel liner, if provided, may be included to satisfy the requirement for inside face reinforcement. Reinforcing bars considered as face reinforcement shall not be more than one-fifth of the total section thickness from the concrete face.

considered as face reinforcement shall not be more than one-fifth of the total section thickness from the concrete face.

CC-3536 Curved Reinforcement

All forces imposed by curved reinforcement shall be considered in the design of local areas such as around penetrations.

CC-3540 PRESTRESSED CONCRETE

CC-3541 General

(a) Provisions in this Subarticle apply to structural members prestressed with high strength steel meeting the requirements for prestressing material in CC-2400.

(b) The following assumptions shall be made for purposes of design.

Page 77

(1) Strains vary linearly with depth through the entire load range.

(2) At cracked sections, the ability of the concrete to resist tension is neglected.

(3) In calculations of section properties prior to bonding of tendons, areas of the open ducts shall be deducted. The transformed area of reinforcing steel and bonded tendons may be included.

(c) The effects on the adjoining structure of elastic and plastic deformations, deflections, changes in length, and rotations caused by the prestressing shall be provided for.

CC-3542 Loss of Prestress

(a) To determine the effective prestress, allowance for the following sources of loss of prestress shall be considered:

(1) slip at anchorage;

(2) elastic shortening of concrete;

(3) creep of concrete;

(4) shrinkage of concrete;

(5) stress relaxation;

(6) frictional loss due to intended or unintended curvature in the tendons.

(b) Friction losses in post-tensioned steel shall be based on experimentally determined wobble and curvature coefficients and shall be verified during stressing operations. The values of coefficients assumed for design and the acceptable ranges of jacking forces and steel elongations shall be specified. These friction losses shall be calculated as follows:

$$(22) P_s = P_x e^{(Kl + \mu\alpha)}$$

When $(Kl + \mu\alpha)$ is not greater than 0.3, Eq. (24) may be used:

$$(23) P_s = P_x (1 + Kl + \mu\alpha)$$

(c) When prestress in a member may be reduced through its connection with adjoining elements, such reduction shall be allowed for in the design.

CC-3543 Tendon End Anchor Reinforcement

Reinforcement oriented perpendicular to the direction of applied force shall be provided to control cracking in the end anchor zone.

(a) Reinforcement shall be sized to resist a load of at least 10% of the applied permanent prestressing force. This reinforcement shall be located starting not more than 2 in. (51 mm) from the bearing plate and extending not more than twice the minimum bearing plate width when measured in the direction of the load.

(b) In lieu of the provisions of (a) above, reinforcement may be based on the result of tests which show that the end anchor zone can adequately resist a force equivalent to the design ultimate force of the prestressing tendon.

CC-3544 Curved Tendons

All forces imposed by curved tendons shall be considered in the design of local areas, such as around penetrations.

CC-3545 Radial Tension Reinforcement

For portions of prestressed containments with curvature, consideration shall be given to the radial forces. Radial reinforcement shall be provided to resist radial tensile forces from curved tendons in portions of the containment with double curvature.

The spacing of reinforcement shall not be greater than the shell thickness or 3 ft (0.9 m), whichever is smaller. The radial reinforcement shall be developed on either side of the centroid of the curved tendons in accordance with CC-3530.

CC-3550 SEPARATION OF STRUCTURES

Since the containment will deform under the design loadings and temperature effects, such deformations and interaction with integral, adjacent, and internal structures and components shall be considered in the design of the containment; otherwise, the containment shall be sufficiently separated from adjacent and internal structures to ensure no contact during deformation.

CC-3560 FOUNDATION REQUIREMENTS

CC-3561 General

(a) The foundation properties used in the design shall be supported by analysis made from information provided by laboratory or field tests of specimens taken from the subsurface strata supporting the containment.

(b) The bottom of the foundation shall be placed at a sufficient distance below finished grade to preclude the possibility of undermining due to flood or possible future adjacent construction.

(c) The short-term as well as the long-term foundation soil properties shall be considered. In order to

Page 78

ensure use of the maximum loading conditions, a range of values of soil constants shall be used which bracket the expected values.

CC-3564 Water Table

The design analysis shall include the effect of possible significant changes in the groundwater table. The effect of moisture changes upon the soils being loaded shall be included in the settlement analysis.

CC-3565 Deterioration of Material

The design shall provide due protection against possible deterioration of the foundation material.

CC-3566 Containment Displacement

Containment movements shall be considered in determining potential interaction with adjacent or attached piping or equipment. Long-term settlements, such as consolidation of clay or silt layers, shall be given full consideration. An investigation shall be made to preclude the founding of a containment on strata subject to liquefaction under the specified design conditions.

The load combinations shown in Table CC-3230-1 are applicable to containment displacement considerations, except that load factors for all load cases shall be taken equal to 1.0.

CC-3570 CONTAINMENT EXTERNAL ANCHORS

CC-3571 General

The effects of anchors, embedments, or other attachment details not attached to the steel liner or a load carrying steel element, that provide anchorage into the containment concrete from the external surface, shall be considered. The anchors are, however, not under the jurisdiction of the Code. The induced effects on the containment shall be considered in accordance with this Section.

CC-3572 Loads and Displacements

The resulting loads on the containment shall be considered in the appropriate load categories and load combinations as described in Section CC-3200 of the Code. Containment displacements and their effects shall be considered in accordance with Section CC-3550 and Section CC-3566 of the Code.

CC-3573 Analysis Methods

The analysis necessary to predict the effects of such anchors shall be consistent with Section CC-3300 of the Code.

CC-3574 Design Allowables

The effects of the anchors shall not cause stresses or strains, in combination with the other loads on the containment as determined by Sections CC-3572 and CC-3573, that exceed the allowables of Section CC-3400 of the Code.

CC-3575 Additional Design Requirements

The Design Specification shall contain requirements that the external anchors are designed to preclude structural damage to the containment.

CC-3600 LINER DESIGN ANALYSIS PROCEDURES

CC-3610 GENERAL

(a) An analysis shall be prepared in sufficient detail to show that each of the design allowables of CC-3700 is satisfied when the liner, penetrations, brackets, and attachments are subjected to the loadings of CC-3200.

(b) Experimental results may be used to evaluate the capacity of components to withstand static or cyclic loading.

CC-3620 LINER

The liner analysis shall consider deviations in liner geometry due to the fabrication and erection tolerances, which are stated in CC-4522, and any additional tolerances stated in the Construction Specification. Since the liner will be anchored at relatively close intervals compared to its diameter, the analysis may be based on plate or beam theory, provided all assumptions made in the analysis are conservative.

CC-3630 LINER ANCHORS

The anchors may be analyzed assuming the liner remains elastic under all conditions; for example, the liner strains shall be converted to stress using Hooke's law with the modulus of elasticity and Poisson's ratio below yield. If the liner stress and resulting membrane

Page 79

forces are substantially higher than the uniaxial yield strength, then biaxial tests may be performed to determine the biaxial yield. If biaxial yield tests are performed, the anchor loads may be determined considering the liner in a plastic state when justified by the design.

CC-3640 PENETRATION ASSEMBLIES

The penetration assemblies shall be analyzed using the same techniques and procedures used for metal containments in Division 1, where applicable. The analysis shall consider the concrete confinement for penetration sleeves embedded in the

concrete containment. Local thickening of the liner at an opening is allowed.

CC-3650 BRACKETS AND ATTACHMENTS

Brackets and attachments connected to the liner shall be designed and analyzed using accepted techniques applicable to beams, columns, and weldments such as those illustrated in AISC, Manual for Steel Construction, Part 5, Specification for Design, Fabrication, and Erection of Structural Steel for Buildings.

CC-3700 LINER DESIGN

CC-3710 GENERAL

Due to the nature of the loads and other effects, together with the types of components, the allowable capacities of the components will be specified in terms of stress, strain, force or displacement, whichever is applicable. Since many of the allowable capacities are based on ultimate capacities, testing of a prototype may be necessary to verify the ultimate capacity of a particular part.

CC-3720 LINER

The calculated strains and stresses for the liner shall not exceed the values given in Table CC-3720-1. The load combinations shown in Table CC-3230-1 are applicable to the liner, except that load factors for all load cases may be taken equal to 1.0. Strains associated with construction-related liner deformations may be excluded when calculating liner strains for the Service and factored load combinations.

**TABLE CC-3720-1
LINER PLATE ALLOWABLES**

Stress-Strain Allowable [Note (1)]		
Category	Membrane	Combined Membrane and Bending
Construction	$f_{st} = f_{sc} = \frac{2}{3} f_{py}$	$f_{st} = f_{sc} = \frac{2}{3} f_{py}$
Service	$\epsilon_{st} = \epsilon_{sc} =$ 0.002 in./in.	$\epsilon_{st} = \epsilon_{sc} =$ 0.004 in./in.
Factored	$\epsilon_{sc} = 0.005$ in./in. $\epsilon_{st} = 0.003$ in./in.	$\epsilon_{sc} = 0.014$ in./in. $\epsilon_{st} = 0.010$ in./in.

NOTE:

(1) The types of strains limited by this Table are strains induced by other than construction-related liner deformations.

TABLE CC-3720-1 LINER PLATE ALLOWABLES

CC-3730 LINER ANCHORS

(a) The liner shall be anchored to the concrete so that the liner strains do not exceed the strain allowable given in CC-3720. The anchor size and spacing shall be chosen so that the response of the liner is predictable for all the loads and load combinations given in CC-3200. The anchorage system shall be designed so that it can accommodate the design in-plane (shear) loads or deformations exerted by the liner and loads applied normal to the liner surface.

(b) The allowable force and displacement capacity are given in Table CC-3730-1. The load combinations shown in Table CC-3230-1 are applicable to the liner anchors, except that load factors for all load cases may be taken equal to 1.0. Mechanical loads are those which are not self-limiting or self-relieving with load application. Displacement limited loads are those resulting from constraint of the structure or constraint of adjacent material and are self-limiting or self-relieving.

(c) The anchorage forces to be transferred to the concrete shall be established in the Design Specification.

CC-3740 PENETRATION ASSEMBLIES

(a) Each penetration shall be provided with an anchorage system capable of transferring loads and thermal effects to the concrete. The anchorage design shall be in accordance with liner anchor requirements.

(b) The design allowables for the penetration nozzles shall be the same as those used for Division 1. A nozzle is a part of the assembly not backed up by concrete.

Page 80

**TABLE CC-3730-1
LINER ANCHOR ALLOWABLES**

Category	Force and Displacement Allowables	
	Mechanical Loads, Lesser of:	Displacement Limited Loads
Test, normal, severe environmental, extreme environmental	$F_a = 0.67 F_y$ $F_a = 0.33 F_u$	$\delta_a = 0.25 \delta_u$
Abnormal, abnormal/severe environmental, abnormal/extreme environmental	$F_a = 0.9 F_y$ $F_a = 0.5 F_u$	$\delta_a = 0.50 \delta_u$

CC-3730-1 LINER ANCHOR ALLOWABLES

(c) The design allowables for the liner in the vicinity of the penetration shall be the same as those given in AISC, Specification for the Design, Fabrication, and Erection of Structural Steel for Buildings, for resisting mechanical loads² in service load category. For factored load categories, the allowables may be increased by a factor of 1.5, except for impulse loads and impact effects.

(d) The portion of the penetration sleeve backed by concrete shall be designed to meet the requirements of CC-3700 and CC-3800.

(e) The anchorage forces to be transferred to the concrete shall be established in the Design Specification.

CC-3750 BRACKETS AND ATTACHMENTS

(a) The design allowables for brackets, attachments, and the liner in their vicinity shall be the same as those given in AISC, Manual for Steel Construction, Part 5, Specification for the Design, Fabrication, and Erection of Structural Steel for Buildings, for resisting mechanical loads² in the construction, test, and normal categories. For all other categories, the

allowables may be increased by a factor of 1.5, except for impulse loads and impact effects.

- (b) The anchorage forces to be transferred to the concrete shall be established in the Design Specification.

2 Mechanical loads are those loads which are not self-limiting.

CC-3760 FATIGUE

In general, the design of liners is not fatigue controlled since most stress and strain changes will occur only a small number of times and produce only minor stress-strain fluctuations. The occurrence of earthquake and design basis accident full-design strains occurs too infrequently and with too few cycles to generally be controlling. Nevertheless, because of the critical nature of the liner, the Designer shall ensure the suitability of the liner for the specific operating conditions involving cyclic application of loads and thermal conditions that have been established in the Design Specification. The fatigue methods and limits established by Division 1 shall apply.

CC-3800 LINER DESIGN DETAILS

CC-3810 LINER ANCHORS

The anchor design and analysis shall consider the effects of the following.

- (a) The unbalanced loads resulting from the variation of liner curvature. Some areas of the liner may have inward curvature between the anchors, whereas other areas will have outward curvature. The variation will result in shear load and displacement at the anchor.

- (b) Liner thicker than nominal due to the rolling tolerances given in SA-20. The thicker plate will impose greater forces and displacements on the anchorage system than a nominal thickness liner.

- (c) Yield strength higher than the minimum specified due to the rolling processes and biaxial loading. Adequate consideration of yield strength in excess of the minimums may be provided by the following:

- (1) converting liner strains to stress and membrane forces assuming the material remains elastic;

- (2) conducting biaxial yield strength tests to establish the biaxial yield strength of materials used for the liner. Biaxial yield strength tests are required only when anchor designs rely on liner yielding to limit the forces applied to the anchors.

- (d) weld offset, structural discontinuities, and concrete voids behind the liner;

Page 81

- (e) variation in anchor spacing;

- (f) variation in anchor stiffness due to a variation of the concrete modulus;

- (g) local concrete crushing in the anchor zone;

- (h) Stud anchors shall be designed to fail before tearing the liner.

CC-3820 PENETRATION LINERS

For penetration assemblies designed for pipe rupture loads, the design shall consider one of the following:

- (a) the moment, axial, torque, and shear loadings that the piping is capable of producing;

- (b) penetration loads based on a dynamic analysis considering pipe rupture thrust as a function of time.

CC-3830 TRANSITIONS FROM CONCRETE TO STEEL

CC-3831 Transition Details

When containments use a combination of concrete and metal (Fig. CC-3831-1), the design rules below shall govern. Transition sections shall be divided into two categories.

(a) Category One: full-containment diameter transitions, penetration with nozzles embedded in the concrete containment wall for attachment of piping, hatches, and locks;

(b) Category Two: local zones backed up by compressible materials.

CC-3831.1 Category One: Transition Section

(a) Metal sections not backed by concrete shall meet all the design requirements of Division 1 and shall consider the concrete confinement.

(b) Metal sections may be attached to the concrete portion of the containment with anchor rods, anchor bolts, attachment to the primary reinforcement or prestressing system, or any anchorage method capable of transferring the design loads.

CC-3831.2 Category Two: Transition Sections.

Metal sections backed up by compressible material to provide local flexibility shall meet all design requirements of Division 1 in the region where compressible material is present. Where the sections attach to concrete backed or embedded members, only the requirements of CC-3000 apply.

CC-3840 WELDED CONSTRUCTION

CC-3841 Joint Category

The term *category* as used herein defines the location of a joint in a liner and illustrates some acceptable details. The joints included in each category are designated A, B, C, D, E, F, G, H, and J. Figure CC-3831-1 illustrates typical joint locations.

(a) *Category A*: longitudinal welded joints within the liner or penetration nozzles

(b) *Category B*: circumferential welded joints within the liner or penetration nozzles

(c) *Category C*: detailed descriptions and requirements for this category are covered in Division 1

(d) *Category D*: welded joints connecting penetration nozzles in the liner

(e) *Category E*: welded joints connecting flat liner bottom sections to elements of spherical, cylindrical, or conical liner sections or for intersection of liner sides to sides, or sides to bottoms

(f) *Category F*: welded joints connecting liner floor plates together and to liner transition sections and joints connecting liner sides and bottom plates together

(g) *Category G*: welded joints connecting the sides of liner side plates to liner floor plates

(h) *Category H*: welded joints connecting attachments to liner and embedment anchors to attachments to liners or other embedment anchors

(i) *Category J*: welded joints connecting liner plates to embedments that are continuous throughout liners

CC-3842 Permissible Types of Welded Joints

Joints of any category shall meet the requirements of CC-3830 for transition zones from concrete to steel when compressible material is present between the liner and the concrete.

CC-3842.1 Category A.

All welded joints of Category A shall meet the fabrication requirements of CC-4542 and shall be capable of being examined in accordance with CC-5520.

CC-3842.2 Category B.

All welded joints of Category B shall meet the fabrication requirements of CC-4542 and shall be capable of being examined in accordance with CC-5520.

CC-3842.3 Category C.

Rules for joints of Category C are included in Division 1.

Page 82

Page 83

FIG. CC-3831-1 ILLUSTRATION OF WELDED JOINT LOCATIONS TYPICAL OF ALL CATEGORIES
(For Definitions of Categories see CC-3841)

FIG. CC-3831-1 ILLUSTRATION OF WELDED JOINT LOCATIONS TYPICAL OF ALL CATEGORIES

CC-3842.4 Category D

(a) Joints of Category D shall meet the requirements of Fig. CC-4542.2-1 for nozzles over 3 in. diameter.

(b) Joints of Category D shall meet the requirements of Fig. CC-4542.2-2 for nozzles 3 in. diameter and under.

CC-3842.5 Category E.

Joints shall be of the type shown in Fig. CC-4542.2-3.

CC-3842.6 Category F.

Joints shall be of the type shown in Fig. CC-4542.2-4.

CC-3842.7 Category G.

Joints shall be of the type shown in Fig. CC-4542.2-5.

CC-3842.8 Category H.

Welded joints shall be of the type shown in Fig. CC-4542.2-6.

CC-3842.9 Category J.

Welded joints shall be of the type shown in Fig. CC-4542.2-7.

CC-3842.10 Minimum Dimensions.

The minimum dimensions of Fig. CC-4542.2-1 through Fig. CC-4542.2-7 shall be met where:

t	= nominal thickness of liner
t_a	= nominal thickness of attachments to liner
t_c	= $0.7t_r$, $0.7t_1$, $0.7t_a$ or $\frac{1}{4}$ in. (6 mm), whichever is less
$t_{\min}$	= the smaller of $\frac{3}{4}$ in. (19 mm) or the thickness of the thinner of the parts joined
t_n	= nominal thickness of penetrating part
t_w	= $0.7t_{\min}$
t_1, t_2	= not less than the smaller or $\frac{1}{4}$ in. (6 mm) or $0.7t_{\min}$
$t_1, t_2 \geq \frac{1}{4}t_{\min}$	
r_1	= $\frac{1}{4}t$ or $\frac{3}{4}$ in. (19 mm), whichever is less
r_2	= $\frac{1}{4}$ in. min.

CC-3843 Unequal Thickness Transitions

A tapered transition section having a length not less than three times the offset between the adjacent section surfaces as shown in Fig. CC-3840-1 shall be provided at joints of Categories A and B between sections that differ in thickness by more than one-fourth of the thickness of the thinner section. The transition section may be formed by any process that will provide a uniform taper.

CC-3900 DESIGN CRITERIA FOR IMPULSE LOADINGS AND MISSILE IMPACT

CC-3910 GENERAL

Containment and liner shall be designed to resist the effects of impulse loadings from pipe rupture and the impact of missiles resulting from pipe rupture, tornadoes, or any other missile specified in the Design Specification in accordance with CC-3200. Load classifications are given in CC-3240.

CC-3920 DESIGN ALLOWABLES

CC-3921 General

CC-3921.1 Normal and Severe Environmental Load Categories.

Structural members designed to resist loads in the normal and severe environmental load categories are not allowed to exceed yield.

CC-3921.2 Abnormal, Extreme Environmental, Abnormal and Extreme Environmental Load Categories.

Structural members designed to resist impulse loads and dynamic effects in the abnormal, extreme environmental, and abnormal and extreme environmental categories are allowed to exceed yield strain and displacement values. Design adequacy is controlled by limiting the ductility³ assumed in evaluating the energy absorption capability or resistance function of the structure.

CC-3922 Stress Allowables

The allowables applicable to the determination of section strength are given in CC-3400 and CC-3700. In determining f_y values, the dynamic effect of the loading may be considered.

CC-3923 Ductility Limits

CC-3923.1 Impulse Loads.

The ductility limits used in design for impulse load shall not exceed one-third the ductility determined at failure.

CC-3923.2 Impact Effects.

The ductility limits used in design for impact load shall not exceed two-thirds the ductility determined at failure.

³ Ductility μ is defined as the ratio of maximum deformation or strain of the member at the point of collapse to the maximum elastic deformation or strain.

NOTE:
(1) Length of taper may include the width of the weld.

FIG. CC-3840-1 TAPERED TRANSITION SECTIONS

FIG. CC-3840-1 TAPERED TRANSITION SECTIONS

CC-3930 DESIGN ASSUMPTIONS

CC-3931 Penetration Formulas and Impulse or Impact Effects

Empirical penetration formulas are assumed to govern design local to the missile impact area. Missile penetration shall be limited to 75% of total section thickness. Local areas for missile impact are defined as having a maximum diameter equal to 10 times the mean diameter of the impacting missiles, or $5\sqrt{t}$ plus the mean diameter of the impacting missile where t is defined as the total section thickness in feet, whichever is smaller. The effect of damage in the local missile impact area shall be considered in the overall structural integrity of the section.

CC-3932 Effective Mass During Impact

For a concrete section, the effective diameter of the section to be used in determining the kinetic energy transferred on missile impact or the dynamic characteristics of the structural response shall be equal to the mean diameter of the missile plus one section thickness t . Larger values of effective mass may be used if a test or analytical verification is available to substantiate the use of larger values.

July 1, 1998
American Society Of Mechanical Engineers

CC-4100 GENERAL REQUIREMENTS

CC-4110 INTRODUCTION

Concrete containments shall be fabricated and constructed in accordance with the requirements of this Article. The requirements apply whether performed in a shop or at the field site. Unless otherwise indicated, throughout this Article the term *component* shall be understood to include parts and appurtenances. The fabrication of parts and appurtenances designated to meet the requirements for Class MC and which are not backed up by concrete for load carrying purposes shall meet the requirements of NE-4000 and Subsection NCA. Attachments to parts fabricated to the requirements of Division 1 shall meet the requirements of this Article.

CC-4120 CERTIFICATION OF MATERIAL AND FABRICATION OR CONSTRUCTION BY COMPONENT FABRICATOR OR CONSTRUCTOR

CC-4121 Means of Certification

The Fabricator or Constructor of a concrete containment or component shall certify, by application of the appropriate Code symbol and completion of the appropriate Data Report in accordance with Article NCA-8000, that the materials used comply with the requirements of CC-2000 and that the fabrication and construction complies with the requirements of CC-4000.

CC-4121.1 Certification of Treatments, Tests, and Examinations.

If the Fabricator or Constructor performs treatments, tests, repairs, or examinations required by other Articles of this Division, he shall certify that he has fulfilled those requirements. Reports of all required treatments and of the results of all required tests, repairs, and examinations shall be available to the Authorized Inspector.

CC-4121.2 Repeat of Tests.

If, during the fabrication or construction of the component, the material is subjected to conditions which cause a change in principal characteristics that has not been accounted for in the Design Report and that may change properties from the specified values, the tests shall be repeated or additional tests made by the Fabricator or Constructor for verification of acceptability.

CC-4122 Material Identification

CC-4122.1 Concrete.

Each *concrete placement* (defined as a placement made continuously between construction joints) shall be identified on the as-built sketch, and records maintained of the date, concrete batch tickets with traceability to the information required in CC-4220, and testing performed in accordance with CC-5230.

CC-4122.2 Reinforcing Material.

Reinforcing steel, by groups of bars or shipments, shall be identifiable by documentation, tags, or other means of control to a specific heat number or heat code until review of the CMTR has been performed. After acceptance of the reinforcing steel, adequate documentation, tags, or other means shall be provided to ensure traceability to an accepted shipment or to groups of accepted shipments of reinforcing steel.

CC-4122.3 Prestressing System Material.

Material for prestressing systems shall carry identification markings or tags which shall remain distinguishable until

the tendon assembly is completed. If the original identification markings are cut out or the material is divided into two or more pieces, the markings shall be accurately transferred to the pieces prior to cutting, or a coded marking or other means of control shall be used to ensure identification of each piece of material during the subsequent assembly. A tabulation shall be made of the CMTR for the materials used in an assembly or group of assemblies.

Page 90

CC-4122.4 Liner Material.

Material for liners (excluding leak-chase system materials, embedments, and attachment material) shall carry identification markings which will remain distinguishable until the liner is assembled. If the original identification markings are cut out or the material is divided into two or more pieces, the marks shall either be accurately transferred to all pieces prior to cutting or a coded marking shall be used to ensure identification of each piece of material during subsequent fabrication or installation. In either case, an as-built sketch or a tabulation of materials shall be made identifying each piece of material with the CMTR and the coded marking. Welding and brazing materials shall be identified and controlled so that they can be traced to each liner, or else a control procedure shall be employed which ensures that the specified materials are used.

CC-4122.5 Control of Material.

Material shall be controlled, marked, and identification maintained in accordance with NCA-4134.7 and NCA-4134.8.

CC-4123 Examinations

Visual examination activities that are not referenced for examination by CC-5000 and are performed solely to verify compliance with requirements of CC-4000 are not required to be performed by personnel and procedures qualified to CC-5000 unless so specified.

CC-4200 CONCRETE

CC-4210 GENERAL

The Construction Specification shall specify the requirements for stockpiling, batching, mixing of concrete constituents, conveying, depositing, consolidating, and curing of concrete and construction joint preparation. The Construction Specification shall specify any requirements or special procedures to be followed to limit concrete temperature.

CC-4220 STORING, BATCHING, MIXING, AND PLACING

CC-4221 Stockpiling and Storing

CC-4221.1 Aggregates.

Aggregates shall be handled, transported, and stockpiled in a manner that will minimize segregation and ensure that the fineness moduli and gradation are maintained within the range specified. Intermixing between stockpiles shall be prevented. Suitable storage facilities shall be provided to ensure that the above requirements are met. Aggregates shall be sampled and tested in accordance with the requirements of CC-5223.

CC-4221.2 Moisture Control.

Cement, admixtures, and other concrete and grout constituents that are adversely affected by moisture before mixing shall be stored, handled, and transported in a manner that will prevent the introduction of moisture. If the above materials are exposed to moisture after testing, they shall be resampled and tested before use in accordance with the requirements of CC-5220.

CC-4222 Batching

CC-4222.1 General.

The Construction Specification for batching of constituents for concrete manufacture shall be based on ACI 304. Only constituents from stockpiles or storage containers which have been accepted shall be used. Constituents shall be removed from storage in a manner such that the distribution of particle sizes remains within the ranges specified. Aggregate shall be rescreened if necessary to maintain specified gradation.

CC-4222.2 Measuring.

Aggregates, cements, ice, and mineral admixtures shall be measured by weight. Liquids may be measured by volume or weight. Free moisture content of aggregates and admixtures shall be determined and accounted for as corrections to the amount of added mixing water as differentiated from total mixing water requirements. The measurement accuracy and precision shall be such that the proportion of constituents stays within the ranges established in ASTM C 94, Specification for Ready-Mixed Concrete. The $\pm 1\%$ tolerance for water specified in ASTM C 94 may be modified to $\pm 2\%$ if permitted in the Construction Specification and if the plant can demonstrate a standard deviation less than 400 psi (2800 kPa) as determined by ACI 214. Records shall be maintained of the constituent quantities in each batch. Recording paper divisions or digital printout records shall be capable of verifying conformance to $\pm 1\%$ for the measurements of cement, total aggregates, mineral admixtures and water, and to $\pm 3\%$ for liquid admixture.

CC-4223 Mixing

CC-4223.1 General.

All concrete shall be mixed in accordance with the requirements set forth in ASTM C 94 and any additional requirements of the Construction Specification.

Page 91

CC-4223.2 Operation of Mixers.

The range of mixing capacities and corresponding mixing times for all mixers shall be determined by the performance of mixer uniformity tests as specified in ASTM C 94. Mixers shall be used only within the range of capacities and mixing times qualified by mixer uniformity tests.

CC-4224 Conveying

CC-4224.1 General.

Concrete shall be conveyed from the mixer to final placement by methods which will prevent the separation or loss of materials.

CC-4224.2 Conveying Equipment.

Conveying equipment shall be capable of providing a supply of concrete at the site of placement without separation of constituents and without interruptions that cause loss of plasticity between successive increments. The delivery rate shall be such that unconsolidated material is not covered by newly deposited concrete, and new material is not placed on concrete which has hardened unless the surface of the hardened material has been properly prepared as a construction joint. Performance of all conveying equipment including hoppers, buckets, conveyors, pumps, and chutes shall be selected and employed so that the concrete shall meet the specified characteristics. Concrete, during conveyance, shall not come in contact with aluminum.

CC-4225 Depositing

CC-4225.1 General.

Concrete shall be deposited as near as practicable to its final position to avoid segregation due to rehandling or flowing. The placing operation shall be conducted at such a rate that the concrete is at all times plastic and flows readily into forms and around reinforcement and embedments. Concrete that is partially hardened or contaminated shall not be deposited in the structure. Pretempered concrete or concrete which has been remixed after initial set shall not be used.

CC-4225.2 Continuity.

Concreting shall be a continuous operation until the placement is completed. The top surfaces of vertically formed lifts shall be generally level. Location and preparation of construction joints shall be in accordance with CB-4252.

CC-4226 Consolidation

CC-4226.1 General.

Concrete shall be thoroughly worked around the reinforcement and embedments and into corners of the forms. ACI 309, Recommended Practice for Consolidation of Concrete, shall be used as a guide to develop suitable consolidation techniques.

CC-4226.2 Use of Mortar.

Where placement and consolidation conditions are difficult, or where reinforcement is congested, batches of mortar containing the same proportions of cement and sand as used in the concrete shall first be deposited in the forms to the depth specified. Sufficient water shall be added to the mortar to provide necessary workability, but the water-cement ratio shall not exceed the water-cement ratio of the specified concrete design mix.

CC-4226.3 Placeability Tests.

When required by the Construction Specification, one or more mockups shall be prepared and filled with the specified concrete to demonstrate that the concrete can be properly placed and consolidated under field conditions. The mockup shall contain representative amounts of reinforcing steel, tendon tubes, and embedments. Vibrators, equipment, and procedures used in the tests shall be representative of those that will be used in the actual construction.

CC-4230 PREPLACED AGGREGATE CONCRETE

CC-4231 General

The Construction Specification shall prescribe complete specifications for materials, locating and placing grout pipes, preplacing and compacting coarse aggregates, grout pumps and equipment, preparation for grouting, completing the top surface, and the grout mix design, fluidity, and temperature. Specifications and procedures shall be based on ACI 304.

CC-4240 CURING

(a) The concrete shall be cured and protected against thermal and physical damage from the time of placement until the end of the minimum curing period specified in the Construction Specification.

(b) Special requirements on the type and duration of the curing process shall be established in the Construction Specification together with the details of any special conditions to be maintained during the curing period.

(c) During cold weather, the surfaces of the concrete placement shall be maintained above 40°F (4°C) for a minimum period of the first three days. Cold weather is defined as a period when for more than three successive days, the average daily outdoor temperature drops below 40°F (4°C). The average daily temperature

Page 92

is the average of the highest and lowest temperature during the period from midnight to midnight. When temperatures above 50°F occur for more than half of any 24 hr duration, the period should no longer be regarded as cold weather.

(d) The period for protection against freezing may be reduced if it can be demonstrated that the compressive strength of the concrete is at least 500 psi (3.4 MPa) and the structure has no early strength requirements.

CC-4250 FORMWORK AND CONSTRUCTION JOINTS

CC-4251 Formwork Design

CC-4251.1 General.

Forms shall result in a final structure which conforms to the shape, lines, and dimensions required by the Design Drawings and shall be substantial and sufficiently tight to prevent leakage of mortar. They shall be properly braced, tied, or supported to maintain position and shape within the limits prescribed by the Construction Specification.

CC-4251.2 Design of Formwork.

The Construction Specification for the design of formwork shall be based on ACI 347, Recommended Practice for Concrete Formwork, and shall include consideration of the following factors:

- (a) rate and method of placing concrete;
- (b) density of concrete;
- (c) construction loads, including vertical, horizontal, and impact loads.

CC-4251.3 Use of the Liner as Formwork.

In using the steel containment liner as formwork, special attention shall be given to liner supports and the height of lifts to prevent exceeding the tolerance requirements of CC-4522.

CC-4252 Construction Joints

Construction joints shall be located only as shown on the Design Drawings. The Construction Specification shall specify the method of their preparation. Specific attention shall be given to ensure that before concrete is placed, all debris, water, and ice are removed from the space to be occupied by the concrete. Joint preparation shall include removal of all laitance and other unsound material from hardened concrete surface, roughening of the surface to uniformly expose the aggregate, and saturating of the surface before additional concrete is placed.

CC-4253 Precast Concrete Segments

Where precast concrete segments will be used as forms, the Construction Specification shall specify the alignment tolerance, the type of joints between elements, the surface preparation, and ties required to ensure attachment to the containment concrete. Precast concrete segments shall be supported adequately to prevent displacement during concreting.

CC-4260 COLD AND HOT WEATHER CONDITIONS

Cold and hot weather procedures shall be in accordance with the Construction Specification. The Construction Specification shall establish a permissible range of as-placed temperatures for the concrete and may specify the preheating or precooling of the concrete constituents, or the use of ice or other means to control the temperature of the concrete, including maximum rate of cooling to prevent thermal shock. Such procedures shall be based on the information provided in ACI 305R, Hot Weather Concreting and ACI 306R, Cold Weather Concreting.

CC-4270 REPAIRS TO CONCRETE

Honeycombed or defective concrete shall be repaired or removed and replaced as directed by the Designer. Adjoining surfaces shall be prepared as specified for construction joints (CC-4252).

CC-4280 CEMENT GROUT FOR GROUTED TENDON SYSTEMS

CC-4281 Equipment for Grouting

- (a) Equipment for measuring and batching grout constituents shall be accurate within $\pm 3\%$.
- (b) Material shall be mixed in equipment that will produce grout of uniform consistency, free from lumps and undispersed cement. The grout shall be continuously agitated until pumped.
- (c) The pump shall be of the positive displacement type and shall be capable of exerting the required maximum pressure.

A safety device shall be provided to guard against exerting a pump discharge pressure in excess of 300 psi (2070 kPa). The pump shall not draw air in with the grout.

(d) A screen shall be provided between the mixer and the pump to ensure that the grout does not contain lumps.

Page 93

(e) The equipment shall be designed to prevent leakage and segregation of grout.

CC-4282 Grouting

(a) Grouting shall be carried out as promptly as possible after tensioning. The total time of exposure of the tendon steel to other than a controlled environment prior to grouting shall be specified in the Construction Specification and shall not exceed 30 days, nor shall the period between tensioning and grouting exceed 7 days unless special precautions are taken to protect the tendon against corrosion. The methods or products used in that case shall not jeopardize either the effectiveness of the grout as a corrosion inhibitor or the bond between the prestressing element and the grout. The Designer shall evaluate the potential corrosive effects of the local atmospheric conditions to determine if additional restrictions on the above limits must be established in the Construction Specification.

(b) Flushing before grouting is not recommended. When flushing has to precede the grouting, appropriate measures shall be taken and specified in the Construction Specification to ensure that:

(1) the level of harmful substances in the in-place grout does not increase above that of the designed grout;

(2) the properties of the injected grout satisfy the requirements of CC-2243.

(c) The maximum time after mixing within which the grout can be used shall be specified in the Construction Specification and established by tests that verify:

(1) that the intended reaction of the admixtures, such as expansive agents, continues when such a grout is injected in the duct; and

(2) that this time is 2 hr less than that required for the initial set of the grout as determined in accordance with ASTM C 191.

(d) The temperature at any point in the tendon duct during grouting shall be above 40°F (4°C). The end anchorages and the tendon duct shall be maintained above 40°F (4°C) for a period of 48 hr after grouting or until the grout reaches a minimum of 800 psi (5.5 MPa) compressive strength. The grout temperature shall not exceed 100°F (38°C) during mixing and pumping.

(e) The development of the grouting procedure shall consider the extremes of anticipated environmental conditions. The procedure will ensure that the ducts will be filled.

(f) All openings, air vents, and drains shall be hermetically sealed after grouting to prevent the ingress of water or any corrosive agents. When an expansive grout is used, all high point openings shall remain open to permit free expansion until grout sets.

CC-4300 FABRICATION OF REINFORCING SYSTEMS

CC-4310 GENERAL

This Subarticle covers the fabrication requirements for the reinforcing systems of concrete containments.

CC-4320 BENDING OF REINFORCING BAR

CC-4321 Standard Hooks

CC-4321.1 Definition.

The term *standard hook* as used herein shall mean either:

(a) a semicircular turn plus an extension of at least 4 bar diameters, but not less than $2\frac{1}{2}$ in. (64 mm) at the free end of the bar; or

(b) a 90 deg. turn plus an extension of at least 12 bar diameters at the free end of the bar; or

(c) for stirrup and tie anchorages:

(1) for No. 5 bar and smaller, a 90 deg. turn plus an extension of 6 bar diameters;

(2) for Nos. 6 through 8 bar, a 90 deg. turn plus an extension of 12 bar diameters;

(3) for No. 8 bar and smaller, a 135 deg. turn plus an extension of 6 bar diameters.

CC-4321.2 Diameter.

The diameter of bend measured on the inside of the bar for standard hooks shall not be less than the values of Table CC-4322-1, except for stirrups and ties in sizes Nos. 3 through 5.

CC-4322 Stirrups, Tie Hooks, and Bends Other Than Standard Hooks

(a) Inside diameter of bends for stirrups and ties shall not be less than 4 bar diameters for No. 5 bar and smaller.

(b) Bends for all other bars shall have diameters on the inside of the bar not less than allowed by Table CC-4322-1.

CC-4323 Bending

CC-4323.1 Fabrication of Bars.

When bending is required, it shall be performed prior to embedding the bars in the concrete except as permitted in CC-4323.2. All bars to be bent shall be cold bent prior to embedment in concrete, except as permitted in CC-4323.2.

Page 94

**TABLE CC-4322-1
MINIMUM DIAMETER OF BEND**

Bar Size	Minimum Diameter, bars
No. 3–No. 8	6
No. 9–No. 11	8
No. 14, No. 18	10

TABLE CC-4322-1 MINIMUM DIAMETER OF BEND

CC-4323.2 Bending of Bars Partially Embedded in Set Concrete.

Bending or straightening of bars partially embedded in set concrete shall not be permitted, except in isolated cases where corrective action or a field change is required and is specifically approved by the Designer. The bend diameters shall conform to the requirements of Table CC-4322-1. In addition, the beginning of the bend shall not be closer to the

shall conform to the requirements of Table CC-4322-1. In addition, the beginning of the bend shall not be closer to the existing concrete surface than is shown in Fig. CC-4323-1. The following requirements shall be adhered to for individual bar sizes.

(a) Bar Nos. 3 through 5 may be cold bent once. Preheating in accordance with CC-4323.3 is required for subsequent straightening or bending.

(b) Bar No. 6 and larger shall be preheated in accordance with CC-4323.3

(c) Examination of all bends shall be in accordance with CC-5340.

CC-4323.3 Preheating.

Preheating prior to bending or straightening, when required, shall be in accordance with the following rules.

(a) Preheating may be applied by any method which does not harm the bar material or cause damage to the concrete.

(b) The preheat shall be applied to a length of bar equal to 5 bar diameters each way from the center of the bend, except that preheat shall not extend below the surface of the concrete. The temperature of the bar at the concrete interface shall not exceed 500°F (260°C).

(c) The preheat temperature shall be 1100°F to 1200°F (593°C to 649°C).

(d) The preheat temperature shall be maintained until bending or straightening is complete.

(e) The preheat temperature shall be measured by temperature measurement crayons or contact pyrometer.

CC-4323.4 Tolerances.

Bars used for concrete reinforcement shall meet fabricating tolerance requirements specified in the Construction Specification.

D = minimum diameter of bend from Table CC-4322-1

FIG. CC-4323-1 ALLOWABLE BEND CONFIGURATION

CC-4330 SPLICING OF REINFORCING BARS

CC-4331 Introduction

CC-4331.1 General.

Splicing of reinforcing bars shall be made only as required or permitted by the Designer.

CC-4331.2 Permitted Types of Splices and Joints.

The types of splices and joints listed in (a), (b), and (c) below are permitted within the limitations described in the following subparagraphs:

- (a) lap splices
- (b) mechanical splices of the following types:
 - (1) sleeve with ferrous filler metal splices
 - (2) taper threaded splices
 - (3) swaged splices
 - (4) threaded splices in thread deformed reinforcing bars
 - (5) sleeve with cementitious grout
- (c) arc-welded joints

CC-4332 Lap Splices

Lap splice requirements are stated in CC-3532.

CC-4333 Mechanical Splices

CC-4333.1 Qualifications, Records, and Identifying Stamps

CC-4333.1.1 Required Qualifications.

Each Constructor or Fabricator is responsible for the splicing made by his organization and he shall conduct the tests required by this Subarticle in order to qualify the splicing procedure and the splicers.

CC-4333.1.2 Maintenance and Certification of Records.

The Constructor or Fabricator shall maintain a record of the splicing procedure and the splicers qualified and employed by him, showing the date and results of tests, and the identification mark or marks assigned to each splicer. These records shall be reviewed, verified, and signed by an authorized individual assigned by the Constructor. The records shall be accessible to the Owner and to the Authorized Inspector.

CC-4333.1.3 Splicing Prior to Qualification.

No splicing shall be undertaken until a splicer has been qualified. Only splicers who are qualified in accordance with CC-4333.4 shall be used.

CC-4333.2 Splice System Qualification Requirements

CC-4333.2.1 General Requirements.

Each splice system Manufacturer shall conduct a series of performance tests in order to qualify his splice system for use.

CC-4333.2.2 Materials to Be Used for Performance Tests.

The types of materials to be used for the performance test splices shall be the same as those intended for use in production splices. The actual materials used and the necessary dimensions of all test specimens shall be documented.

CC-4333.2.3 Type and Number of Performance Tests

(a) *Static Tensile Tests.* Six splice specimens for each bar size and splice type to be used in construction shall be tensile tested to failure using the loading rate set forth in SA-370. For swaged or sleeve with cementitious grout splices, three different deformation patterns shall be used for each bar size tested. The static tensile tests shall be repeated for each bar grade to be used in construction for taper threaded splices and threaded splices in thread deformed reinforcing bars. For taper threaded splices, one of the six specimens shall be tested at 20°F (-7°C) or less. A tensile test on an unspliced specimen from the same bar used for the spliced specimens shall be performed to establish actual tensile strength. The average tensile strength of the splices shall not be less than 90% of the actual tensile strength of the reinforcing bar being tested, nor less than 100% of the specified minimum tensile strength. The tensile strength of an individual splice system shall not be less than 125% of the specified minimum yield strength of the spliced bar. Each individual test report on both the spliced and unspliced specimens shall include at least the following information:

- (1) tensile strength;
- (2) total elongation;
- (3) load-extension curve to a minimum of 2% strain.

The gage length for each pair of spliced and unspliced specimens shall be the same, and equal to the length of splice sleeve, plus not less than 1 bar diameter nor more than 3 bar diameters at each end. For taper threaded splices, one of the splice specimens shall be cold soaked for a minimum of 24 hr prior to testing at a temperature equal to or less than the temperature required for this test. The test temperature at the root of the critical thread shall be 20°F (-7°C) or less and maintained until the specimen reaches yield level load.

(b) *Cyclic Tensile Tests.* Three specimens of the bar-to-bar splice for each reinforcing bar size (and grade for taper threaded splices and threaded splices in thread deformed reinforcing bar) and splice type to be used in construction shall be subjected to a low cycle tensile test. Each specimen shall withstand 100 cycles of stress variation from 5% to 90% of the specified minimum yield strength of the reinforcing bar. One cycle is defined as an increase from the lower load to the higher load and return.

CC-4333.2.4 Essential Variables.

The performance tests must be completely reconducted when any of the applicable changes listed below are made. Changes other than those listed may be made without the necessity for repeating the performance tests.

- (a) for all splice systems:
 - (1) a change in splice sleeve material or grade
 - (2) a reduction in the cross-sectional area of the splice sleeve
 - (3) a reduction in the bar engagement length
 - (4) an increase in reinforcing bar grade
- (b) for sleeve with ferrous filler metal splices, a change in the filler metal;
- (c) for taper threaded splices:

- (1) a change in thread geometry
 - (2) a change in torque
 - (d) for swaged splices:
 - (1) a change in swaging pressure
 - (2) a change in die geometry
 - (3) a change in stud material
 - (4) a change in outside or inside diameter
-

Page 96

- (5) for heated splices, a change in the required minimum temperature of the sleeve at the time of swaging and maximum time and temperature that sleeves may be held in the heating oven
- (e) for threaded splices in thread deformed bar:
 - (1) a change in thread geometry
 - (2) a change in torque
- (f) for sleeve with cementitious grout splices:
 - (1) a change in the cementitious grout formulation
 - (2) a change in the deformation pattern inside the sleeve
 - (3) a change in the reinforcing steel deformation pattern
 - (4) a change in temperature limits for the splice system (bar, sleeve, grout) during placement and curing of grout.

CC-4333.3 Requirements for Production Splicing Procedures.

All production splicing shall be performed in accordance with a written procedure which shall include, as a minimum, the procedures used for the performance tests in CC-4333.2.3, with the following additional information:

- (a) for sleeve with ferrous filler metal splices:
 - (1) bar end preparation
 - (2) cleanliness requirements
 - (3) bar end location tolerances
 - (4) permissible gap between reinforcing bar ends
 - (5) allowable voidage in the filler metal
- (b) for taper threaded splices:
 - (1) type of equipment and methods used to verify bar thread acceptability
 - (2) cleanliness requirements
 - (3) type of equipment and methods used for torquing
 - (4) required force and method of measurement
 - (5) method of mechanically locking the position splices
 - (6) method used to verify the final alignment and engagement of the splice on both bars
- (c) for swaged splices:

- (1) cleanliness requirements
- (2) type of equipment and methods used for swaging
- (3) required swaging pressure, method of measurement, pressure tolerance, and frequency of calibration of the hydraulic system
- (4) method used to verify final alignment and engagement of the splice on both bars
- (5) bar end preparation
- (6) minimum and maximum number of swaging operations per sleeve
- (7) method used to ensure sleeve is swaged along full length
- (8) limits of die wear and frequency of checking
- (9) for heated sleeves, limits and methods used to measure duration and temperature of heating cycle and temperature of sleeve at time of swaging
- (10) method used to ensure that stud is locked to swaged sleeve
- (d) for threaded splices in thread deformed bar:
 - (1) type of equipment and methods used to verify bar thread acceptability
 - (2) cleanliness requirements
 - (3) type of equipment and methods used for torquing
 - (4) required torque, tolerance on required torque, and method of measurement
 - (5) method used to verify the final alignment and engagement of the splice coupler on both bars
 - (6) method used to lock the coupling in position to prevent loosening of the splice
- (e) for sleeve with cementitious grout splices:
 - (1) bar end preparation
 - (2) cleanliness requirements
 - (3) bar end location tolerances
 - (4) bar and sleeve centering tolerances
 - (5) permissible gap between reinforcing bar ends
 - (6) allowable voidage in the grout
 - (7) procedures for storing, mixing, placing, and curing the grout
 - (8) maximum and minimum temperature of the splice system during placement and curing of grout
 - (9) restriction to prevent relative bar movement during setting and strength development of the grout

CC-4333.4 Initial Qualification Tests.

Each splicer shall prepare two qualification splices on the largest bar size to be used. In addition, for ferrous filler metal splices, cementitious grouted splices, and swaged splices only, each of the splice positions to be used (e.g., horizontal, vertical, diagonal) shall be qualified. The qualification splices shall be made using reinforcing bar identical to that to be used in the structure. The completed qualification splices shall be tensile tested using the loading rates set forth in SA-370 and the tensile results shall meet those specified in Table CC-4334-1.

CC-4333.5 Continuing Splice Performance Tests

CC-4333.5.1 Introduction.

A continuing series of tests shall be made to ensure that production splices meet the tensile requirements. Nondestructive examination requirements are specified in CC-5320.

Page 97

CC-4333.5.2 Splice Samples.

Splice samples may be production splices (cut directly from in-place reinforcement) or straight sister splices (removable splices made in place next to production splices and under the same conditions), in accordance with the schedule established in CC-4333.5.3.

CC-4333.5.3 Testing Frequency.

Splice samples shall be tensile tested in accordance with the following schedule for the appropriate splice system.

(a) Separate test cycles shall be established for sleeve with ferrous filler metal splices, sleeve with cementitious grout splices, and swaged splices in horizontal, vertical, and diagonal bars. Straight sister splices may be substituted for production test samples on radius bent bars and for splicing sleeves arc welded to structural steel elements or the liner.

(1) For sleeve with ferrous filler metal splices, one splice shall be tested for each unit of 100 production splices.

(2) For swaged splices and sleeve with cementitious grout splices, test cycles shall be established as follows.

(a) If only production splices are tested, the sample frequency shall be as follows:

(1) 1 of the first 10 production splices;

(2) 1 of the next 90 production splices;

(3) 2 of the next units and each subsequent unit of 100 production splices.

(b) If production and sister splices are tested, the sample frequency shall be as follows:

(1) 1 production splice of the first 10 production splices;

(2) 1 production and 3 sister splices for the next 90 production splices;

(3) 3 splices, either production or sister splices, for the next and each subsequent unit of 100 production splices.

At least one-fourth of the total number of splices tested shall be production splices.

(b) Taper threaded splices and threaded splices in thread deformed reinforcing bar. Separate test cycles shall be established for each bar size and grade, using straight sister splices as follows:

(1) 1 of the first 10 splices;

(2) 1 of the next 90 splices;

(3) 2 of the next and subsequent units of 100 splices.

In addition, for taper threaded splices, a minimum of three tests shall be made for each bar heat.

CC-4333.5.4 Tensile Testing Requirements.

Splice samples shall be tensile tested using the loading rates set forth in SA-370. All taper threaded sample splices shall be tensile tested at 20°F (-7°C) or less. The following shall constitute the acceptance standards.

(a) The tensile strength of each sample shall equal or exceed 125% of the specified yield strength as shown in Table CC-4334-1.

(b) The average tensile strength of each group of 15 consecutive samples shall equal or exceed the specified

minimum tensile strength as shown in Table CC-4334-1.

If any sample tested fails to meet the provisions of (a) or (b) above, the requirements of CC-4333.5.5 shall be followed.

CC-4333.5.5 Substandard Tensile Test Results

(a) If any splice used for testing fails to meet the strength requirement of Table CC-4333-1 and failure occurs in the bar, the cause of the bar break shall be investigated by the Constructor or Fabricator. Any necessary corrective action affecting splice samples shall be implemented prior to continuing the testing frequency of CC-4333.5.3.

(b) If any splice used for testing fails to meet the strength requirement of Table CC-4333-1 and failure does not occur in the bar, two additional splices shall be tested. If either of these retests fails to meet the strength requirement of Table CC-4333-1, splicing shall be halted. Splicing shall not be resumed until the cause of failures has been corrected and resolved.

(c) If the running average tensile strength of 15 consecutive samples fails to meet the tensile requirement of Table CC-4333-1, splicing shall be halted. The Constructor or Fabricator shall investigate the cause and make the necessary corrective action.

(d) When splicing is resumed, the testing frequency shall be started anew.

CC-4333.6 Recording of Tensile Test Results.

The results of all tensile tests obtained from the tests prescribed by CC-4333.4 and CC-4333.5, along with all other pertinent data, shall be recorded.

CC-4333.7 Welding.

Welding of splice sleeves to parts shall be performed using welding procedures and welders qualified in accordance with AWS D1.1 or Section IX.

CC-4333.8 Impact Requirements.

When reinforcing bar or mechanical splices are to be welded to material that requires impact testing, the following shall apply.

(a) The weld filler metal shall be impact tested in accordance with the requirements of the material that the reinforcing bar is attached to.

(b) The acceptance criteria of the material requiring impact testing shall be met.

**TABLE CC-4333-1
TENSILE REQUIREMENTS FOR MECHANICAL REINFORCING BAR SPLICES AND WELDED JOINTS**

Specification	Reinforcing Bar Properties		Splice or Joint Strength Requirements		
	Bar Grade	Minimum Yield Strength, psi	Minimum Tensile Strength, psi	Minimum Average Mechanical Splice or Welded Joint Tensile Strength, psi [Note (1)]	Minimum Single Mechanical Splice or Welded Joint Tensile Strength, psi [Note (2)]
ASTM A 615	Grade 40	40,000	70,000	70,000	50,000
ASTM A 615	Grade 60	60,000	90,000	90,000	75,000
ASTM A 706		60,000	80,000	80,000	75,000

NOTES:

(1) See CC-4333 and Appendix XI.

(2) These values are equivalent to 125% of the yield strength of each bar grade.

TABLE CC-4333-1 TENSILE REQUIREMENTS FOR MECHANICAL REINFORCING BAR SPLICES AND WELDED JOINTS

CC-4334 Arc Welded Joints

Refer to Appendix XI for qualification requirements.

CC-4340 PLACING REINFORCEMENT

CC-4341 General

The placement of reinforcing steel shall comply with the Design and Construction Drawings and the placing tolerances specified in the Construction Specification.

CC-4342 Supports

Reinforcement shall be accurately placed and adequately supported before concrete is placed and shall be secured against displacement beyond permitted tolerances. Welding of crossing bars shall not be permitted.

CC-4343 Tolerances

The tolerances for the placement of reinforcement shall be specified in the Construction Specification.

CC-4350 SPACING OF REINFORCEMENT

CC-4351 Layers

The clear distance between parallel bars in a layer and the clear distance between parallel layers of reinforcement shall not be less than that required by the Construction Specification to properly place and consolidate concrete.

CC-4352 Splices

The clear distance limitation between bars shall also apply to the clear distance between a contact (lap) splice and adjacent splices or bars.

CC-4360 SURFACE CONDITION

(a) Reinforcing bars at the time concrete is placed shall be free from mud, oil, ice, snow, or other coatings that adversely affect bonding.

(b) Reinforcing bars with rust, mill scale, or a combination of both shall be considered satisfactory provided the minimum dimensions, including height of deformations and weight of a hand wire brushed test specimen, are not less than ASTM A 615 requirements.

CC-4400 FABRICATION AND INSTALLATION OF PRESTRESSING SYSTEMS

CC-4410 GENERAL

This Subarticle covers the requirements for the fabrication, installation, tensioning, and protection of prestressing tendons.

CC-4420 RECEIVING, STORING, AND HANDLING OF MATERIAL

The construction procedures shall specify the manner in which material is to be received, stored, and handled in the Fabricator's plant and at the construction site.

Page 99

The Constructor's, Fabricator's, or Material Supplier's Quality Assurance Program shall provide for material identification and segregation in accordance with CC-2152. The handling shall not cause detrimental mechanical damage to the material. The Construction Specification shall establish requirements for storage of all material to ensure that it is protected from detrimental corrosion. Limits of detrimental corrosion shall be specified in the Construction Specification.

CC-4430 TENDON FABRICATION

CC-4431 Anchorage Components

CC-4431.1 Bearing Plate - Trumpet Assembly.

All welding shall be performed using welding procedures and welders qualified in accordance with Section IX. The suggested preheat schedules of Appendix D of this Division shall be taken into account.

CC-4431.2 Anchor Assemblies, Couplings, Wedge Blocks, Shims, Wedges, and Anchor Nuts.

The construction procedures shall set forth the manufacturing limits and tolerances applicable to these items.

CC-4432 Tendon Assembly

CC-4432.1 Introduction.

The following subparagraphs apply to both shop and field assembly operations.

CC-4432.2 Cutting.

The construction procedures shall specify the methods and procedures for cutting and cutting tolerances of prestressing elements.

CC-4432.3 Assembly Procedures.

A detailed fabrication procedure, including a checklist of work and information as required by the construction procedures, shall be prepared before tendon fabrication. The checklist information for each tendon shall include traceability data such as heat number or element coil number, anchorage component serial numbers, etc. It shall also include length, location, numerical designations of the tendons, and the temporary corrosion protection of the tendon.

CC-4432.4 Details.

Attention shall be given to specific aspects such as dimensions, geometry, concentricity, alignment, angularity, and surface conditions. Limits and tolerances of these aspects shall be specified in the construction procedures.

CC-4432.5 Twisting and Coiling.

Prestressing tendons comprised of multiple elements shall be twisted, as necessary, to minimize differential length of the individual prestressing steel elements. Twisting is mandatory for all horizontal circumferential tendons comprised of multiple elements stressed simultaneously as a group. The amount of twist shall be specified in the construction procedure. Coiling, when required for transportation, shall be performed in a manner not to cause damage to the tendon. Coil diameter shall be specified in the construction procedures.

CC-4432.6 Corrosion Protection Applied During Fabrication.

The type of corrosion protection, the detailed procedure for its application, and the pertinent time limitations shall be specified in the construction procedures.

CC-4440 TENDON IDENTIFICATION

Upon completion of fabrication into a whole or partial tendon, the tendon shall be identified with a tendon number. The materials in the tendon shall be recorded so that they can be traced to the tests which have determined their quality.

CC-4450 TENDON INSTALLATION

CC-4451 Installation Procedure

A detailed installation procedure, including a checklist of work and information as required by the construction procedures, shall be prepared before the tendon installation. The checklist shall include lengths, locations, and numerical designations of the tendons; inspection and preparation of the tendon ducts; method and materials for the corrosion protection of the tendons; requirements for welding or burning where tendons are handled and installed; and sequencing of installation. Prestressing system components shall not be installed, or shall be removed and replaced, if handling or storage causes their characteristics to change beyond the tolerances established in the Construction Specification.

CC-4452 Tendon Ducts and Channels

The Construction Specification shall specify the tolerances for position and alignment. Tendon ducts and channels shall be adequately supported against displacement during concreting. Open ducts shall be protected by capping or plugging to prevent entry of concrete or other deleterious material. All joints shall be made tight against the inleakage of mortar or appreciable water from the fresh concrete. The Construction Specification shall specify the temporary corrosion protection system, if any, and the construction procedures shall define the method for its application. All water and

Page 100

debris shall be removed from ducts prior to installation of tendons.

CC-4460 POST-TENSIONING

CC-4461 Supervision

Prestressing operations shall be under the direction of an experienced supervisor and shall be carried out only by trained operators.

CC-4462 Stressing Sequence

The required sequence of prestressing shall be specified in the Construction Specification.

CC-4463 Alignment

Components of the tensioning equipment shall be accurately set and supported in line with the axis of the tendon to which they are fitted, and they shall be squarely seated on each other and on the anchorage before stressing is commenced. All anchorages, temporary connections, and jacks shall be checked for alignment before transmitting any significant load to the tendon.

CC-4464 Load and Extension Measurement

CC-4464.1 Procedure.

Tendon extension shall be measured during the application of the jacking force. The measurement of extension shall commence at a specified load of approximately 10% of the ultimate load of the tendon. The calculated elongation due to the initial force applied prior to commencing measurement shall be added to the measured elongation. In addition, proper allowance shall be made for any significant elongations within the stressing equipment if they are included in the measured elongation. The load applied to any tendon immediately prior to anchoring shall not exceed the limits prescribed in the Construction Specification. The tensioning load shall be measured by load cells or equivalent means having an accuracy not less than $\pm 2\%$ of the required tensioning force. Hydraulic pressure gages or dynamometers shall be calibrated against standards traceable to the National Standards before their use in the prestressing operation. Pressure gages and jacks shall be calibrated as a unit and shall always be used together. During stressing, records shall be made of elongations as well as forces obtained. Dynamometer or gage readings shall be checked against elongation of the tendons. The cause of any discrepancy exceeding $\pm 10\%$ for individual tendons and $\pm 5\%$ for the average of all tendons of one family (configuration; for example, hoop, dome, inverted U-shaped) of tendons of that predicted by calculations, using average load elongation curves, shall be resolved in consultation with the Designer. Final elongation and stress shall be recorded.

CC-4464.2 Lubricants.

If lubricants are used to reduce friction, they shall comply with the requirements of CC-2442.

CC-4465 Loss of Prestressing Force

The loss of prestressing force due to unreplaced, broken, or damaged prestressing elements shall not exceed the percentage of the total prestressing force specified in the Construction Specification.

CC-4470 PERMANENT CORROSION PROTECTION

CC-4471 General

The Construction Specification shall specify the permanent corrosion protection system, if any, and the construction procedures shall define the method for its application. Material shall conform to the requirements of CC-2442.3 or CC-2240.

CC-4472 Cement Grout for Grouted Tendon Systems

The sequence and specific procedures for batching, mixing, pumping, and placing of cement grout for bonded tendon systems shall be specified in the Construction Specification and conform to the requirements of CC-4280.

CC-4500 FABRICATION OF LINERS

CC-4510 GENERAL REQUIREMENTS

CC-4511 Introduction

(a) The rules in the following paragraphs apply specifically to the fabrication and construction of metal liners.

(b) Each Fabricator or Constructor shall be responsible for the quality of the welding done by his organization and he shall conduct tests not only of the welding procedure to determine its suitability to ensure welds which will meet the required tests, but also of the

Page 101

welders and welding operators to determine their ability to apply the procedure properly.

(c) No production work shall be undertaken until both the welding procedure and the welders or welding operators have been qualified in accordance with Section IX.

CC-4512 Elimination and Repair of Defects

Defects in materials may be eliminated or repaired by the Constructor or Fabricator by welding provided the defects are removed, repaired, and examined in accordance with the requirements of CC-2530 for the applicable product form.

CC-4520 FORMING, FITTING, AND ALIGNING

CC-4521 Cutting, Forming, and Bending

CC-4521.1 Cutting.

Liner material, edges of heads, and other parts may be cut to shape and size by mechanical means, such as machining, shearing, grinding, or by oxygen or arc cutting. After oxygen cutting, all slag, dross, or other foreign material shall be removed by mechanical means prior to further fabrication or use.

CC-4521.1.1 Preheating Prior to Thermal Cutting.

When thermal cutting is performed to prepare weld joints or edges, to remove attachments or defective material, or for any other purpose, consideration shall be given to preheating the material using preheat schedules such as suggested in Appendix D.

CC-4521.2 Forming and Bending Processes.

Any process may be used to hot or cold form or bend liner plate materials, including weld metal, provided the notch toughness properties of the materials, where required, are not reduced below the minimum specified values, or they are effectively restored by heat treatment following the forming operation. *Hot forming* is defined as forming with the material temperature higher than 100°F below the lower critical temperature of the material.

CC-4521.2.1 Required Postweld Heat Treatment.

Cold-formed shell sections and heads of P-No. 1 materials shall be postweld heat treated when the resulting maximum extreme fiber elongation is more than 5%.

CC-4521.3 Qualifications of Forming and Bending Processes.

A procedure qualification test shall be conducted on specimens taken from coupons of the same material specification, grade or class, heat treatment, and similar impact requirements as employed for the material of the component involved. These coupons shall be subjected to the equivalent forming or bending process and heat treatment as the material of the component involved. Applicable tests shall be conducted to determine that the required impact properties are met after straining.

CC-4521.3.1 Exemptions.

Procedure qualification tests are not required for the following:

- (a) hot-formed material, such as forgings, in which the hot forming is completed by the Material Manufacturer prior to removal of the impact test specimens;
- (b) hot-formed material represented by test coupons which have been subjected to heat treatment representing the hot-forming procedure and the heat treatments to be applied to the parts;
- (c) material which does not require impact testing in accordance with CC-2500;
- (d) material which has a final strain after forming of less than 0.5%;
- (e) material where the final strain is less than that of a previously qualified procedure for the material;
- (f) material from which the impact testing is required by CC-2522 to be performed on each heat and lot, as applicable, after forming.

CC-4521.3.2 Procedure Qualification Test.

The Procedure qualification test shall be performed in the following manner.

- (a) The tests shall be performed on three different heats of material both before and after straining to establish the effects of the forming and subsequent heat treatment operations.
- (b) Specimens shall be taken in accordance with the requirements of this Division and shall be taken from the tension side of the strained material.
- (c) The percent strain shall be established by the following formulas.

For cylinders

$$\% \text{ strain} = \frac{50t}{R_f} \left(1 - \frac{R_f}{R_o} \right)$$

For spherical or dished surfaces

$$\% \text{ strain} = \frac{75t}{R_f} \left(1 - \frac{R_f}{R_o} \right)$$

For pipe

$$\% \text{ strain} = \frac{100r}{R}$$

where

t	= nominal thickness
R_f	= final radius to center line of shell
R_o	= original radius (equal to infinity for a flat part)
R	= nominal bending radius to the center line of the pipe
r	= nominal radius of the pipe

(d) The procedure qualification shall simulate the maximum percent surface strain employing a bending process similar to that used in the fabrication of the material or by direct tension on the specimen.

(e) Sufficient Charpy V-notch impact test specimens shall be taken from each of the three heats of material to establish a transition curve showing both the upper and lower shelves. Tests consisting of three impact specimens taken from each of three heats shall be conducted at a minimum of five different temperature distributions throughout the transition range. The upper and lower shelves may be established by the use of individual test specimens. As an alternative to the transition curve, drop weight tests may be used, or one set of Charpy V-notch impact test specimens tested after forming at the specified temperature may be used if performed on each heat or lot, as applicable, of formed material.

(f) From the impact test transition curves or drop weight tests from each of the three heats, both before and after straining, determine either:

(1) the maximum change in temperature considering various energy levels when transition curves are used, or the change in nil-ductility transition (NDT) temperature as determined by the drop weight tests; or

(2) the maximum loss of impact energy for the material considering each temperature increment of 10°F.

CC-4521.3.3 Acceptance Standards.

To be acceptable, the material used in the liner must have impact properties sufficient to compensate for the maximum change in temperature or energy levels established by the qualification procedures for all material subjected to the equivalent strain used in the liner.

CC-4521.3.4 Requalification.

A new procedure qualification test is required when any of the following changes are made:

- (a) where the postweld heat treatment time at temperature is greater than previously qualified (If the material is not postweld heat treated, the procedure must qualify without postweld heat treatment.);
- (b) where the maximum calculated strain of the material exceeds the previously qualified strain by more than 0.5%;
- (c) where preheat over 250°F (121°C) is used in the forming or bending operation but not followed by a subsequent postweld heat treatment.

CC-4521.4 Minimum Thickness of Fabricated Material.

If any fabrication operation reduces the thickness below the minimum required to satisfy the rules of CC-3000, the material may be repaired in accordance with CC-2530.

CC-4522 Forming Tolerances

CC-4522.1 Tolerances for Liner Shells and Heads.

The following Subarticles define the requirements for liner tolerances. The Construction Specification shall state any additional requirements. A guide for dimensional tolerances for liners is provided in Appendix F.

CC-4522.1.1 Tolerances for Liner Shells.

At the specified increments of elevation, the difference between the maximum diameter and the minimum shall not exceed $\frac{1}{2}$ of 1%. This requirement will be satisfied by measuring diameters spaced approximately 30 deg. apart for each 12 ft (3.7 m) of height. The overall containment plumbness of the liner cylinder between the springline (start of dome) and the bottom shall be 1 in 200 based on the total height of the cylinder.

CC-4522.1.2 Tolerance for Liner Heads.

The inner surface of the liner head shall not deviate from the specified shape by more than $1\frac{1}{4}\%$ of the inside diameter of the liner shell.

CC-4522.2 Localized Thin Areas.

Forgings are permitted to have small areas thinner than required if the adjacent areas surrounding each has sufficient thickness to provide the necessary reinforcement.

CC-4522.3 Tolerance Deviations for Liner Parts Fabricated From Pipe.

Liner parts fabricated from pipe meeting all other requirements of this Subarticle may have variations of diameter and deviations from circularity permitted by the material specification for such pipe.

CC-4523 Fitting and Aligning

CC-4523.1 Fitting and Aligning Methods.

Parts that are to be joined by welding may be fitted, aligned, and retained in position during the welding operation by the use of bars, jacks, clamps, tack welds, or temporary attachments.

CC-4523.1.1 Tack Welds.

Tack welds shall be made by qualified welders using qualified welding procedures. Tack welds used to secure alignment shall

either be removed completely when they have served their purpose; or when the tack welds are to become part of the finished weld, their stopping and starting ends shall be properly prepared by grinding or other suitable means so that they may be satisfactorily incorporated into the finished weld.

**TABLE CC-4523-1
MAXIMUM ALLOWABLE OFFSET
IN FINAL WELDED JOINTS**

Section Thickness, in.	Offset
Up to $\frac{3}{4}$, incl.	$\frac{1}{4}t$
Over $\frac{3}{4}$ to $1\frac{1}{2}$, incl.	$\frac{3}{16}$ in.
Over $1\frac{1}{2}$	$\frac{1}{8}t$ to $\frac{1}{4}$ in. max.

TABLE CC-4523-1 MAXIMUM ALLOWABLE OFFSET IN FINAL WELDED JOINTS

CC-4523.2 Maximum Offset of Aligned Sections

(a) Alignment of sections shall be such that the maximum offset of the finished weld will not be greater than the applicable amount listed in Table CC-4523-1, where t is the nominal thickness of the thinner section of the joint.

(b) Joints in spherical liners and within heads and joints between cylindrical shells and hemispherical heads shall meet the requirements of Table CC-4523-1.

CC-4523.2.1 Fairing of Offsets.

Any offset within the allowable tolerance provided above shall be faired to at least a three to one taper over the width of the finished weld or, if necessary, by adding additional weld metal beyond what would otherwise be the edge of the weld.

CC-4523.3 Support During Concreting.

The liner shall be adequately supported, braced, and tied to prevent displacement beyond the tolerances set forth in CC-4522.

CC-4530 WELDING QUALIFICATIONS

CC-4531 General Requirements

CC-4531.1 Types of Processes Permitted.

Only those welding processes which are capable of producing welds in accordance with the welding procedure qualification requirements of Section IX and this Division may be used for welding liners or attachments thereto, except as otherwise permitted by CC-4333.7. Any process used shall be such that the records required by CC-4532.2 can be made.

CC-4531.1.1 Capacitor Discharge Welding.

The capacitor discharge method of welding may be used for temporary attachments directly to the liner, provided any surface defects found upon removal are eliminated in accordance with CC-4545.2.

CC-4531.1.2 Low Energy Capacitor Discharge Welding.

The low energy capacitor discharge method of welding may be used for permanent nonstructural attachments such as strain gages and thermocouples, provided:

(a) the power output is limited to less than 125 W/sec;

(b) a Welding Procedure Specification describing the capacitor discharge equipment, the combination of materials to be joined, and the techniques of application is prepared; qualification of the welding procedure is not required;

(c) the minimum thickness of the material to which the attachment is made exceeds 0.09 in. (2.3 mm).

CC-4532 Welding Qualifications, Records, and Identifying Stamp

CC-4532.1 Required Qualifications

(a) Each Fabricator or Constructor is responsible for the welding done by his organization and he shall establish procedures and conduct the tests required by this Subarticle and by Section IX in order to qualify both the welding procedures and the performance of welders and welding operators who apply these procedures.

(b) Procedures, welders, and welding operators used to join permanent or temporary attachments to liners and to make permanent or temporary tack welds used in such welding shall also meet the qualification requirements of this Subarticle.

(c) When making procedure test plates for butt welds, it is recommended that consideration be given to the effect of angular, lateral, and end restraint on the weldment. The addition of restraint during welding may result in cracking difficulties that otherwise might not occur.

CC-4532.2 Maintenance and Certification of Records.

The Fabricator or Constructor shall maintain a record of his qualified welding procedures and of the welders and welding operators qualified and employed by him, showing the date and results of tests and the identification mark assigned to each welder. These records shall be reviewed, verified, and signed by any authorized individual assigned by the Fabricator or Constructor and shall be accessible to the Owner or his agent and to the Authorized Inspector.

Page 104

CC-4532.2.1 Identification of Joints by Welder or Welding Operator.

The welder or welding operator making permanent welded joints shall be identified by one of the following methods:

(a) The welder or welding operator making a joint shall apply the identification mark assigned by the Fabricator or Constructor on or adjacent to all permanent welded joints. The marking shall be at intervals of 3 ft or less and shall be done with either blunt nose continuous or blunt nose interrupted dot die stamps.

(b) The Fabricator or Constructor shall keep a record of permanent welded joints in a component and of the welders and welding operators making each joint.

(c) When a multiple number of permanent welded joints are made, the Fabricator or Constructor need not maintain a record to identify the welder or welding operator who welded each individual joint provided:

(1) The Fabricator or Constructor maintains a system that will identify the welders or welding operators who made such welds so that the Inspector can verify that the welders or welding operators were properly qualified.

(2) The welds in each category are all of the same type and configuration and are welded using the same welding procedure specification.

(d) The identification of welders or welding operators making tack welds that become part of a permanent weld is not required provided the Fabricator or Constructor maintain a system to permit the Inspector to verify that such tack welds were made by qualified welders or welding operators.

(e) The identification of welders or welding operators is not required for attachment welds provided the Fabricator or Constructor maintains a system to permit the Inspector to verify that all such attachment welds were made by qualified welders or welding operators.

CC-4532.3 Welding Prior to Qualifications.

No welding shall be started until after the welding procedures which are to be used have been qualified. All welders and welding operators shall be qualified in accordance with CC-4534 and Section IX.

CC-4532.4 Transferring Qualifications.

The performance qualification tests for welders and welding operators conducted by one Fabricator or Constructor shall not qualify welders or welding operators to weld for any other Fabricator or Constructor.

CC-4533 General Requirements for Welding Procedure Qualification Tests

CC-4533.1 Conformance to Section IX Requirements.

All welding procedure qualification tests, including stud welding, shall be in accordance with the requirements of Section IX as supplemented by the requirements of this Article.

CC-4533.2 Base Material to Be Employed.

Welding procedure qualifications for materials which have specified impact test requirements shall be made using base materials in accordance with the applicable requirements of QW-403.4 and QW-403.5 of Section IX.

CC-4533.3 Heat Treatment of Qualification Welds for Ferritic Materials.

Postweld heat treatment of procedure qualification welds shall conform to the applicable requirements of CC-4550 and Section IX. The postweld heat treatment time at temperature shall be at least 80% of the maximum time to be applied to the weld material. The postweld heat treatment total time may be applied in one heating cycle.

CC-4533.4 Preparation of Test Coupons and Specimens

(a) Removal of test coupons from the test weld and the dimensions of specimens made from them shall conform to the requirements of Section IX, except the removal of impact test coupons and the dimensions of impact test specimens shall be in accordance with CC-4533.4.1, CC-4533.4.2, and (b) below.

(b) Weld deposit of each process in a multiple process weld shall, where possible, be included in the impact test specimens. When each process cannot be included in the full-size impact test specimen at the $\frac{1}{4}t$ location required by this Section, additional full-size specimens shall be obtained from locations in the test weld that will assure that at least a portion of each process has been included in full-size test specimens. As an alternative, additional test welds can be made with each process so that full-size specimens can be tested for each process.

CC-4533.4.1 Coupons Representing the Weld Deposits.

Impact test specimens and testing shall conform to the applicable requirements of CC-2522.1. The impact specimen shall be located so that the longitudinal axis of the specimen is at least $\frac{1}{4}t$, and where the thickness of the test assembly permits, not less than $\frac{3}{8}$ in. (10 mm) from the weld surface of the test assembly. In addition, when the postweld heat treatment temperature exceeds the maximum temperature specified in CC-4552 and the test assembly is cooled at an accelerated rate, the longitudinal axis of the specimen shall be a minimum of t from the edge of the

test assembly. The specimen shall be transverse to the longitudinal axis of the weld with the area of the notch located in the weld. The length of the notch of the Charpy V-notch specimen shall be normal to the surface

Page 105

of the weld. Where drop weight specimens are required, the tension surface of the specimen shall be oriented parallel to the surface of the test weld assembly.

CC-4533.4.2 Coupons Representing the Heat Affected Zone.

Where impact tests of the heat affected zone are required by CC-4533.5.2, specimens shall be taken from the welding procedure qualification test assemblies in accordance with (a) through (c) below.

(a) If the qualification test material is in the form of a plate or a forging, the axis of the weld shall be oriented either parallel to or perpendicular to the principal direction of rolling or forging.

(b) The heat affected zone impact test specimens and testing methods shall conform to the requirements of CC-2522.1.2. The specimens shall be removed from a location as near as practical to a depth midway between the surface and center thicknesses. The coupons for heat affected zone impact specimens shall be taken transverse to the axis of the weld and etched to define the heat affected zone. The notch of the Charpy V-notch specimen shall be cut approximately normal to the material surface in such a manner as to include as much heat affected zone as possible in the resulting fracture. Where the material thickness permits, the axis of a specimen may be inclined to allow the root of the notch to align parallel to the fusion line. When a grain refining heat treatment is not performed on welds made by the electroslag or electrogas welding process, the notch for the impact specimens shall be located in the grain coarsened region.

(c) For the comparison of heat affected zone values with base material values [CC-4533.5.2(b)], Charpy V-notch specimens shall be removed from the unaffected base material at approximately the same distance from the base material surface as the heat affected zone specimens. The axis of the unaffected base material specimens shall be parallel to the axis of the heat affected zone specimens and the axis of the notch shall be normal to the surface of the base material.

CC-4533.5 Impact Test Requirements.

Impact tests of the weld metal and the heat affected zone are required when impact tests are required for either of the base materials being joined (CC-2521). Exemption from impact testing under CC-2521.1(h) does not apply to weld metal unless the specific weld metal used is included in Table CC-2521.1-1. Exemption from impact testing of the heat affected zone of those base materials exempted by CC-2521.1(h) is not permitted. The welding procedure qualification impact test specimens shall be prepared and tested in accordance with the applicable requirements of CC-2524 and CC-4533.4. Acceptance standards and exceptions to test requirements shall be in accordance with the following subparagraphs. Retests in accordance with the provisions of CC-2527 are permitted.

CC-4533.5.1 Impact Tests of Weld Metal

(a) Impact tests of the weld metal shall be required for welding procedure qualification tests for production weld joints exceeding $\frac{5}{8}$ in. (16 mm) in thickness when the weld will be made on the surface or will penetrate the base material that requires impact testing in accordance with CC-2521. In addition, such testing of the weld metal is required for the welding procedure qualification tests for any weld repair to base material that requires impact testing in accordance with CC-2521, regardless of the depth of the repair. Exemption from impact testing under CC-2521.1(h) does not apply for weld metal of welding procedure qualification tests for either production weld joints or base material repairs, unless the specific weld metal used is included in Table CC-2521.1-1.

(b) The impact test requirements and acceptance standards for welding procedure qualification weld metal shall be the same as specified in CC-2524 for the base material to be welded or repaired. When two materials having different fracture toughness requirements are to be joined by welding, the test requirements and acceptance standards of either material may be used for the weld metal except where otherwise specified by NCA-2143 or other parts of this Section.

(c) Impact tests are not required for austenitic weld metal.

(d) A Welding Procedure Specification qualified to the impact testing requirements of Subsection NB, NC, or NE may be accepted as an alternative to the Welding Procedure Specification impact testing requirements of this Subsection.

CC-4533.5.2 Impact Tests of Heat Affected Zone

(a) Charpy V-notch tests of the heat affected zone of the welding procedure qualification test assembly are required whenever the thickness of the weld exceeds $\frac{5}{8}$ in., and the base materials require impact testing in accordance with the rules of CC-2521. Exemption of base materials by CC-2521.1(h) does not apply to the welding procedure qualification heat affected zone or unaffected base material for such materials. The only exceptions to the requirements are the following:

(1) the qualification for welds in P-No. 1 materials that are postweld heat treated and are made by any process other than electroslag, electrogas, or thermit;

(2) the qualification for weld deposit cladding on any base material.

(b) Impact testing of the procedure qualification test heat affected zone, where required by CC-4533.5.2,

Page 106

shall be conducted in accordance with (b)(1) through (3), or (b)(4) through (6) and (c) below, if applicable.

(1) For tests of welding procedure qualifications for materials that require tests in accordance with CC-2524.2.1 and CC-2524.4.1, when applicable, three Charpy V-notch heat affected zone specimens and three Charpy V-notch unaffected base material specimens shall be tested at a temperature in accordance with CC-2524.1(a)(1). The Charpy V-notch test of the unaffected base material shall meet the requirements of Table CC-2524.2-1 or Table CC-2524.2-2, and Table CC-2524.4-1, if applicable. If the average toughness value of the three heat affected zone specimens is equal to or greater than the average value of the unaffected base material Charpy V-notch specimen, the qualification test shall be considered acceptable and the values and testing temperature shall be recorded on the Welding Procedure Qualification Record. The production base material impact tests may be conducted at temperatures in accordance with CC-2524.1.

(2) If the heat affected zone Charpy V-notch average toughness value of (b)(1) above is less than the unaffected base material value, and the qualification test meets the other criteria of acceptance, the Charpy V-notch test results may be recorded on the Welding Procedure Qualification Record. In this case, either production base material impact tests shall be conducted 30°F lower than required by CC-2524.1; or data which will provide a testing temperature reduction for the production base material below that of CC-2524.1, or an increase in the permissible lowest service metal temperature for the base material for which the welding procedure is being qualified, shall be obtained in accordance with (b)(3) below and included. Alternatively, the welding procedure qualification may be rewelded and retested.

(3) The data for use in (b)(2) above shall be developed by performing additional Charpy V-notch tests on either or both of the welding procedure qualification test heat affected zone and the unaffected base material at temperatures which provide toughness values that meet or exceed those required for the thickness or thickness-strength combination of the material to be welded in production. The average toughness values for the heat affected zone and unaffected base material shall be plotted on a property-temperature chart. The temperature at which these two sets of data exhibit a common acceptable value of toughness for the production thickness or thickness-strength combination involved shall be determined. The determined temperature for the unaffected base material shall be subtracted from the similarly determined temperature for the heat affected zone. This difference, if a positive number, shall be used in (b)(2) above as the adjustment temperature. The welding procedure adjustment temperature shall be added to the highest lowest service metal temperature (LSMT) established by the tests of CC-2524.2.1 for all of the base material to be welded by this procedure in production. If the temperature difference is zero or a negative number, no adjustment is required for the base material to be welded in production, and the minimum temperature established by the tests for CC-2524.2.1 will still apply as stated in (b)(1) above. Where the actual lowest service metal temperature is not required for the production material to be welded (for example, where a testing temperature is established by the Design Specification to determine that the material has adequate toughness to meet the requirements at the specified test temperature) the adjustment temperature determined by the curve shall be used to establish a reduction in the specified testing temperature for the production material. The adjustment temperature shall be used to lower

the specified testing temperature for any production material upon which the procedure will be used.

(4) For tests of welding procedure qualifications for materials that require tests in accordance with CC-2524.2.2, three Charpy V-notch heat affected zone specimens and three Charpy V-notch unaffected base material specimens shall be tested at a temperature lower than or equal to the lowest service metal temperature. The Charpy V-notch impact tests of the unaffected base material shall each meet or exceed the applicable Over $2\frac{1}{2}$ in. (64 mm) thickness requirements of Table CC-2524.2-1 or Table CC-2524.2-2, and Table CC-2524.4-1, if applicable. If the average toughness value of the three heat affected zone specimens is equal to or greater than the average value for the unaffected base material Charpy V-notch specimens, the qualification test shall be considered acceptable. The values and testing temperature shall be recorded on the Welding Procedure Qualification Record.

(5) If the heat affected zone Charpy V-notch average toughness value of (b)(4) above is less than the unaffected base material value, and the qualification test meets the other criteria of acceptance, the Charpy V-notch test results may be recorded on the Welding Procedure Qualification Record. In this case, either production base material impact tests shall be conducted 30°F lower than required by CC-2524.1; or data which will provide a testing temperature reduction for the production base material below that of CC-2524.1, or an increase in the permissible lowest service metal temperature for the base material for which the welding procedure is being qualified, shall be obtained in accordance with (b)(6) below and included. Alternatively, the

Page 107

welding procedure qualification may be rewelded and retested.

(6) The data for use in (b)(5) above shall be developed by performing additional Charpy V-notch tests on either or both of the welding procedure qualification heat affected zone or unaffected base material at temperatures which provide values equal to or greater than the applicable Over $2\frac{1}{2}$ in. (64 mm) thickness requirements of Table CC-2524.2-1 or Table CC-2524.2-2, and Table CC-2524.4-1, if applicable. The average toughness values for the heat affected zone and the unaffected base material shall be plotted on a property-temperature chart. The temperature at which these two sets of data exhibit a common toughness value equal to or greater than the applicable Over $2\frac{1}{2}$ in. (64 mm) thickness requirements of Table CC-2524.2-1 or Table CC-2524.2-2, and Table CC-2524.4-1, if applicable, shall be determined. The determined temperature for the unaffected base material shall be subtracted from the similarly determined temperature for the heat affected zone. This difference, if a positive number, shall be used in (b)(5) above as the adjustment temperature. The adjustment temperature shall be added to the highest T_{NDT} established by the tests of CC-2524.2.2 for all of the base material to be welded by this procedure in production. If the temperature difference is zero or a negative number, no adjustment is required for the base material to be welded in production, and the minimum temperature established by the tests for CC-2524.2.2 will still apply as stated in (b)(4) above. Where the actual T_{NDT} is not required for the production material to be welded (for example, where a testing temperature is established by the Design Specification to determine that the T_{NDT} is at or below the specified temperature) the adjustment temperature determined by the curves shall be used to establish a reduction in the specified testing temperature for the production material. The adjustment temperature shall be used to lower the specified testing temperature for any production material upon which the procedure will be used.

(c) Should the unaffected base material Charpy V-notch impact test results fail to meet the applicable requirements referenced in (b)(1) or (b)(4) above, additional unaffected base material Charpy V-notch impact tests shall be tested at higher temperatures until the applicable requirements are met. Charpy V-notch impact tests of the heat affected zone shall be tested at the same temperature at which acceptable unaffected base material properties were achieved. The rules governing the average toughness of the heat affected zone relative to the average toughness of the unaffected base material shall be followed as in (b)(1) through (b)(3) or (b)(4) through (b)(6) above, as applicable, to determine the data to be recorded on the Welding Procedure Qualification Record.

(d) A Welding Procedure Specification qualified to the impact testing requirements of Subsection NB, NC, or NE may be accepted as an alternative to the Welding Procedure Specification impact testing requirements of this Subsection.

CC-4533.6 Qualification Requirements for Built-Up Weld Deposits.

Built-up weld deposits for base metal compensation shall be qualified in accordance with the requirements of CC-4533.1 to CC-4533.5, inclusive.

CC-4534 Continuing Performance Test for Stud Welding

(a) For each operator, one stud in every 100 production studs shall be tested as follows.

(1) *Unthreaded Studs.* The test studs shall be tested by bending to an angle of 15 deg. by striking with a hammer. The test studs may be welded to a plate attached to the liner adjacent to a stud from the lot under consideration. The plate shall be of the same type and thickness as the liner with dimensions equal to at least four times the diameter of the stud. The temporarily attached plate shall be adequately supported during testing so as to develop the 15 deg. bend in the stud.

(2) *Threaded Studs.* The test studs shall be torque tested with a calibrated torque wrench to the value shown in Table CC-4534-1 for the corresponding diameter and thread of the stud in a device similar to that shown in Fig. CC-4534-1.

(b) If the studs fail, two more of the existing studs from 100 shall be bent or torque tested. If either of these two studs fails, all of the studs represented by the tests shall be torque tested, bend tested, or rejected.

CC-4540 RULES GOVERNING MAKING, EXAMINING, AND REPAIRING WELDS

CC-4541 Precautions to Be Taken Before Welding

CC-4541.1 Identification, Storage, and Handling of Welding Materials.

The Fabricator or Constructor is responsible for control of the welding electrodes and other materials which are used in the fabrication and installation of components (CC-4120). Suitable identification, storage, and handling of electrodes, flux, and other welding materials shall be maintained. Precautions

Page 108

shall be taken to minimize absorption of moisture by electrodes and flux.

GENERAL NOTES:

- (a) Dimensions are appropriate to the size of the stud.
- (b) Threads of the stud shall be clean and free of lubricant other than residual cutting oil.

**FIG. CC-4534-1 TYPICAL TORQUE
TESTING DEVICE**

FIG. CC-4534-1 TYPICAL TORQUE TESTING DEVICE

CC-4541.2 Cleanliness and Protection of Welding Surfaces.

The method used to prepare the base metal shall leave the weld preparation with reasonably smooth surfaces. The surfaces for welding shall be free of scale, rust, oil, grease, and other deleterious material. The work shall be protected from deleterious contamination and from rain, snow, and wind during welding. Welding shall not be performed on wet surfaces.

CC-4542 Rules for Making Welded Joints

CC-4542.1 Category A and B Joints

(a) All welded joints of Category A and B shall be butt joints. The joints may be single or double welded, but backup bars are not allowed except for the first liner plate course and the transition section at the bottom. The first liner plate course shall not exceed 10 ft (3.0 m) in height. However, when reinforced concrete design without prestressing is used, backup bars may be used for the first four liner plate courses up to a maximum height of 35 ft (10.6 m).

(b) Backup bars, when allowed, shall be continuous and any joints shall be made with full penetration welds. When structural shapes are used as backups, these requirements shall apply.

(c) For repairs to the liner after concrete placement, backups may be used.

CC-4542.2 Other Category Joints.

Welded joints of Category D, E, F, G, H, and J shall be single or double welded. Backup bars are permitted except when the weld is to be radiographed. Backup bars, when allowed, shall be continuous and any joints shall be made with full penetration welds. When structural shapes are used as backups, these requirements shall apply. See Fig. CC-4542.2-1 through Fig. CC-4542.2-7 for typical joint details.

CC-4542.3 Double-Welded Joints.

Before applying weld metal on the second side to be welded, the root of double-welded joints shall be prepared by suitable methods such as chipping, grinding, or thermal gouging, except for those processes of welding by which proper fusion and penetration are otherwise obtained and demonstrated to be satisfactory by welding procedure qualification.

CC-4542.4 Single-Welded Joints.

Where single-welded joints are used, particular care shall be taken in aligning and separating the components to be joined so that there will be complete penetration and fusion at the bottom of the joint for its full length.

FIG. CC-4542.2-7 TYPICAL CATEGORY J JOINTS

CC-4542.5 Surfaces of Welds.

The surface of welds shall be free from coarse ripples or grooves, overlaps, and abrupt ridges or valleys. Abrupt changes in section thickness, such as undercuts which do not exceed $\frac{1}{32}$ in. (0.8 mm) for liner plate $\frac{1}{4}$ in. (6 mm) nominal thickness and greater, are permitted. The surface condition of the finished weld shall be suitable for the proper interpretation of nondestructive examinations of the weld. If the surface of the weld requires grinding, care shall be taken to avoid reducing the weld or base material below the required thickness.

CC-4542.6 Welding Components of Different Thicknesses.

When materials or parts of different thicknesses are welded together, there shall be a gradual transition between the two surfaces. The length of the transition may include the weld. The slope of the transition shall be such that the length-offset ratio shall not be less than 3:1.

CC-4542.7 Peening.

Controlled peening may be performed to minimize distortion. Peening shall not be used on the initial layer (root) of the weld nor on the final layer unless the weld is postweld heat treated.

CC-4542.8 Reinforcement of Welds

CC-4542.8.1 Finished Surfaces of Welds and Thickness of Weld Reinforcement.

Welds which are to be radiographed shall be prepared as follows.

(a) The weld ripples or weld surface irregularities on both the inside and outside shall be removed by any suitable mechanical process to such a degree that the resulting radiographic image, due to any irregularities, cannot mask or be confused with the image of any unacceptable discontinuity.

(b) The finished surface of the reinforcement of all butt welded joints may be flush with the base material or may have reasonably uniform crowns, the maximum on each side not to exceed the thicknesses of Table CC-4542-1.

CC-4542.9 Fillet Welds.

Fillet welds may vary from convex to concave. The size of the weld shall be determined in accordance with Fig. CC-4542-1.

CC-4543 Welding of Attachments

CC-4543.1 Material for Permanent Structural Attachments.

Material for lugs, brackets, stiffeners, and

Page 117

other permanent structural attachments which are permanently welded to liners shall meet the requirements of liner material (CC-2500 except CC-2530). If the welds are exempt from postweld heat treatment (CC-4522), the attachments shall meet the fracture toughness requirements of CC-2520 if required by CC-2521.1.

**TABLE CC-4542-1
MAXIMUM THICKNESSES PERMITTED**

Material Nominal Thicknesses, in.	Maximum Reinforcement on Each Side, in.
Up to $\frac{1}{2}$, incl.	$\frac{3}{32}$
Over $\frac{1}{2}$ to 1	$\frac{1}{8}$
Over 1 to 2	$\frac{3}{16}$

TABLE CC-4542-1 MAXIMUM THICKNESSES PERMITTED

CC-4543.2 Welding of Permanent Structural Attachments.

The rules of CC-4532.1 governing welding qualifications shall apply to the welding of both internal and external permanent structural attachments to liner material. Welds shall meet the postweld heat treatment requirements of CC-4552.

CC-4543.3 Lugs and Fitting Attachments.

All lugs, brackets, saddle type nozzles, manhole frames, reinforcement around openings, and other appurtenances shall conform reasonably to the curvature of the shell or surface to which they are attached.

CC-4543.4 Welding of Nonstructural and Temporary Attachments.

Nonstructural attachments, such as lifting lugs, insulation supports, nameplates, locating lugs, and temporary attachments may be noncertified material and may be welded directly to the liner with continuous or intermittent fillet or partial penetration welds, provided the requirements of (a) through (e) below are met.

- (a) The welding procedure and the welders have been qualified in accordance with CC-4532.1.
- (b) The material is identified and suitable for welding.
- (c) The material is compatible with the material to which it is attached.
- (d) The welding material is identified and compatible with the materials joined.
- (e) The welds are postweld heat treated when required by CC-4552.

CC-4543.5 Stud Welding.

When stud welding is employed to attach shear connectors or other connectors or other attachment to the liner, the following rules apply.

- (a) Studs shall be welded to steel members with automatically timed stud welding equipment connected to a suitable power source.

(b) If two or more stud welding guns are to be operated from the same power source, they shall be interlocked so that only one gun can operate at a time and so that the power source has fully recovered from making one weld before another weld is started.

(c) While in operation, the welding gun shall be held in position without movement until the weld metal has solidified.

(d) At the time of welding, the studs shall be free from rust, rust pits, scale, oil, or other deleterious matter that would adversely affect the welding operation.

(e) The areas on the member to which the studs are to be welded shall be free of scale, rust, or other injurious material to the extent necessary to obtain satisfactory welds. These areas may be cleaned by wire brushing, peening, prick punching, or grinding.

(f) Arc shields shall be broken free after welding from shear connector and anchor studs and, where practicable, from all other studs.

(g) The studs, after welding, shall be free from any defect or substance that would interfere with their intended function.

(h) If the reduction in the length of studs as they are welded becomes less than normal (for example, the length of stud after welding is more than $\frac{1}{16}$ in. (1.6 mm) longer than specified), welding shall be stopped immediately and not resumed until the cause has been corrected.

(i) Stud size shall be $\frac{3}{4}$ in. (19 mm) diameter maximum when stud welding is to be performed in any position other than downflat.

CC-4543.6 Special Requirements for Welding.

When a portion of the liner transmits loads in the through thickness direction, one of the following requirements shall be met if the plate subjected to through thickness loading is 1 in. (25 mm) and greater in thickness.

(a) After completion of welding, the base material directly underneath the attachment shall be ultrasonically examined in accordance with the requirements of CC-5500.

(b) A weld metal inlay or overlay shall be made in accordance with Fig. CC-4543.6-1 and ultrasonically examined in accordance with CC-5500, prior to making the weld joining the attachment member to the inlay or overlay.

(c) Special deposition techniques, as illustrated in Fig. CC-4543.6-2, may be used as an alternative to inlay or overlay. Such techniques shall be demonstrated

Page 118

to meet the requirements of (a) above on material thickness equal to or greater than the production thickness but need not be more than 4 in. (102 mm), and on material of the same type and grade as the production material. Pages 119-119

GENERAL NOTE:
 The "size" of an equal leg fillet weld is the leg length of the largest inscribed right isosceles triangle.
 $\text{Theoretical throat} = 0.7 \times \text{size}$.

Equal Leg Fillet Weld

GENERAL NOTE:
 The "size" of an unequal leg fillet weld is the shorter leg length of the largest right triangle that can be inscribed within the fillet weld cross section.

Unequal Leg Fillet Weld

(d) The material shall meet the acceptance standards of SA-770, Through-Thickness Tension Testing of Steel Plates for Special Applications.

CC-4544 Examination of Welds

All welds shall be examined in accordance with the requirements of CC-5500.

CC-4545 Repair of Weld Metal Defects

CC-4545.1 General Requirements.

Unacceptable defects in weld metal detected by methods required by CC-5500 shall be eliminated and, when necessary, repaired with the requirements of the following paragraphs.

CC-4545.2 Elimination of Surface Defects.

Weld metal surface defects may be removed by grinding or machining and not repaired by welding, provided the following requirements are met.

- (a) The thickness of the section is not reduced more than $\frac{1}{16}$ in. (1.6 mm).
- (b) The depression, after defect elimination, is blended uniformly into the surrounding surface.
- (c) The area is examined after blending by a magnetic particle or liquid penetrant method meeting the requirements of CC-5500 to ensure that the defect has been removed or the indication reduced to an acceptable limit.

CC-4545.3 Requirements for Making Repairs to Welds.

Excavated cavities in weld metal, when repaired by welding, shall meet the requirements of the following subparagraphs.

CC-4545.3.1 Defect Removal.

Unacceptable defects detected visually or by the examinations required by CC-5500 shall be removed by mechanical means or by thermal gouging processes. The area prepared for repair shall be examined and comply with the requirements of CC-5533 or CC-5534.

CC-4545.3.2 Requirements for Welding Materials, Procedures, and Welders.

The weld repair shall be made using welding materials, welders, and welding procedures in accordance with CC-4530.

CC-4545.3.3 Blending of Repaired Welds.

After repair the surface shall be blended uniformly into the surrounding surface.

Step 1 Inlay or overlay weldment

Step 2 Completion of weldment

GENERAL NOTES:

- (a) Members may be welded on one side only, or from both sides.
- (b) Inlay or overlay thickness shall be 1/4 in. min. for $t = 1$ in. and shall be increased 1/16 in. for each additional 3/8 in. of t , but need not exceed 1/2 in.
- (c) When T exceeds t , w shall be increased by an additional 1/16 in. for each 3/8 in. of T over t , to a maximum of 1/2 in.
- (d) The minimum specified tensile strength of the electrodes used for inlay or overlay shall not exceed the minimum specified tensile strength of the base material by more than 12 ksi

FIG. CC-4543.6-1 WELD JOINT PRODUCING THROUGH-THICKNESS LOADING

FIG. CC-4543.6-1 WELD JOINT PRODUCING THROUGH-THICKNESS LOADING

CC-4545.3.4 Examination of Repair Welds.

The examination of weld repairs shall be repeated as required for the original weld except that repair of defects originally detected by magnetic particle or liquid penetrant methods, when the repair cavities do not exceed the lesser of $\frac{3}{8}$ in. (10 mm) or 10% of the thickness, need only be reexamined by a magnetic particle or liquid penetrant method.

CC-4545.3.5 Heat Treatment of Repaired Areas.

The area shall be heat treated in accordance with CC-4550 when the original weld required heat treatment.

Page 121

GENERAL NOTE:

Members may be welded on one side only, or from both sides.

NOTE:

- (1) The initial layer(s) shall extend a minimum of $\frac{3}{8}$ in. beyond the toe of the fillet.

FIG. CC-4543.6-2 SPECIAL DEPOSITION TECHNIQUE
FOR WELD JOINT PRODUCING THROUGH-
THICKNESS LOADING (TYPICAL)

FIG. CC-4543.6-2 SPECIAL DEPOSITION TECHNIQUE FOR WELD JOINT PRODUCING THROUGH-THICKNESS LOADING (TYPICAL)

CC-4545.4 Repair of Defective Areas Resulting From Stud Removal

- (a) The areas of liners where defective studs have been removed shall be made smooth and flush by grinding.
- (b) Where in such areas base metal has been pulled out in the course of stud removal, a shielded metal-arc welding process with low hydrogen electrodes in accordance with the requirements of CC-4545.3 shall be used to fill the pockets and the weld surface ground flush.
- (c) Where a replacement stud is to be placed in the defective area, the above repair shall be made prior to welding the replacement stud.

CC-4550 HEAT TREATMENT

CC-4551 Welding Preheat Requirements

CC-4551.1 When Preheat Is Necessary.

The need for preheat and the required temperature of preheat are dependent on a number of factors, such as the chemical analysis, degree of restraint of the parts being joined, temperature elevation, physical properties, and material thicknesses. Some practices used for preheating are given in Appendix D as a general guide for the materials listed by P-Number of Section IX. It is cautioned that the preheating suggested in Appendix D does not necessarily ensure satisfactory completion of the welded joint and that the requirements for individual material within the P-Number listing may have preheating more or less restrictive than this general guide. The Welding Procedure Specification for the material being welded shall specify the minimum preheating requirements under the welding procedure qualification requirements of Section IX.

CC-4551.2 Preheating Methods.

Preheat for welding or thermal cutting, when employed, may be applied by any method which does not harm the base material or any weld metal already applied, or which does not introduce deleterious material into the welding area which is harmful to the weld.

CC-4552 Postweld Heat Treatment Requirements

CC-4552.1 Means of Heating and Cooling.

Postweld heat treatment (PWHT) may be accomplished by any suitable means of heating and cooling provided the required heating and cooling rates, metal temperature, metal temperature uniformity, and temperature control are maintained.

CC-4552.2 PWHT Time and Temperature Requirements

CC-4552.2.1 Requirements for PWHT.¹

Except as otherwise permitted in CC-4552.2.7, all welds, including repair welds, shall be postweld heat treated. During postweld heat treatment, the metal temperature shall be maintained within the temperature ranges and minimum holding times specified in Table CC-4552-1, except as otherwise permitted by CC-4552.2.4(c). P-Number groups in Table CC-4552-1 are in accordance with QW-420 of Section IX. Except as provided in CC-4552.4.3, PWHT shall be performed in temperature-surveyed and -calibrated furnaces, or PWHT shall be performed with thermocouples in contact with the material or attached to blocks in contact with the material. Unless exempted in CC-4552.2.7, all nozzles and penetrations shall be welded into a portion of the liner plate or plates and postweld heat treated as complete subassemblies prior to welding into the liner.

¹ Any postweld heat treatment time which is anticipated to be applied to the material during fabrication or construction after completion of manufacture shall be specified in the Construction

**TABLE CC-4552-1
MANDATORY REQUIREMENTS FOR POSTWELD HEAT TREATMENT (PWHT) OF WELDS¹**

P-Number (Section IX, QW-420)	Holding Temperature Range, °F [Note (2)]	Minimum Holding Time at Temperature For Weld Thickness (Nominal)		
		$\frac{1}{2}$ in. or less	Over $\frac{1}{2}$ in. to 2 in.	Over 2 in.
1	1100–1250	30 min	1 hr/in.	2 hr plus 15 min for each additional inch over 2 in.
8	...	PWHT neither required nor prohibited		

NOTES:

(1) Exceptions to the mandatory requirements of this Table are defined in Table CC-4552-2.

(2) All temperatures are metal temperatures.

TABLE CC-4552-1 MANDATORY REQUIREMENTS FOR POSTWELD HEAT TREATMENT (PWHT) OF WELDS¹

CC-4552.2.2 Time-Temperature Recordings.

Time-temperature recordings of all PWHT shall be made available for review by the Authorized Inspector. Identification on the time-temperature recording shall be to the weld or item as applicable. A summary of the time-temperature recording may be provided for permanent records in accordance with NCA-4134.17(e)(9).

CC-4552.2.3 Definition of Thickness Governing PWHT Time at Temperature Requirements.

Nominal thickness in Table CC-4552-1 and Table CC-4552-2 is the thickness of the weld, liner material, or the thinner of the sections being joined, whichever is less. It is not intended that nominal thickness include material provided for forming allowance, thinning, or mill overrun when excess material does not exceed $\frac{1}{8}$ in. (3.2 mm). For fillet welds, the nominal thickness is the throat thickness; and for partial penetration and material repair welds, the nominal thickness is the depth of the weld groove or preparation.

CC-4552.2.4 Holding Temperatures and Times

(a) The holding time at temperature as specified in Table CC-4552-1 need not be continuous. It may be an accumulation of time of multiple postweld heat treat cycles.

(b) Holding time at temperatures in excess of the minimum requirements of Table CC-4552-1 may be used, provided specimens are tested in accordance with CC-2526, CC-2600, and CC-4530.

(c) Alternatively, when it is impractical to postweld heat treat at the temperature range specified in Table CC-4552-1, it is permissible to perform the postweld heat treatment of P-No. 1 material at lower temperature ranges for longer periods of time in accordance with Table CC-4552-3 and (1) below.

(1) Base materials certified in accordance with CC-2526 may be postweld heat treated at these lower minimum temperatures and increased minimum holding times without recertification. Postweld heat treatment at these lower minimum temperatures and increased minimum holding times may also be the tempering operation, provided a higher tempering temperature is not required by the material specification.

CC-4552.2.5 PWHT Requirements When Differing P-Number Materials Are Joined.

PWHT is not required when joining P-No. 1 material $1\frac{1}{2}$ in. (38 mm) or less in thickness to P-No. 8 materials with electrodes that produce austenitic or non-air-hardening nickel-chrome-iron deposits.

CC-4552.2.6 PWHT Requirements for Material Welded to Liners.

When materials are welded to liner materials, the PWHT temperature range of the liner materials shall control.

CC-4552.2.7 Exemptions to PWHT Mandatory Requirements.

PWHT is not required for the following:

(a) nonferrous material;

(b) welds exempted in Table CC-4552-2;

(c) welds subjected to temperatures above the PWHT temperature range specified in Table CC-4552-1, provided the Welding Procedure Specification is qualified in accordance with Section IX.

CC-4552.3 Heating and Cooling Rate Requirements.

Above 800°F (427°C), the rate of heating and cooling over any hourly interval shall not exceed 400°F (222°C) divided by the maximum thickness in inches of the material being heat treated but shall not exceed 400°F (222°C) and need not be less than 100°F (56°C) over any hourly interval. During the heating and cooling period, there shall not be a greater variation in temperature

Page 123

than 250°F (139°C) within any 15 ft (4.6 m) interval of the weld length.

TABLE CC-4552-2
EXEMPTIONS TO MANDATORY PWHT¹

P-No. (Section IX, QW-420)	Type of Weld	Nominal Thickness (CC-4552.2.3)	Properties of Pressure Retaining Material(s) Being Joined	
			Max. Reported Carbon, %	Min. Preheat Required, °F
1	All welds, including repair welds, in material $1\frac{1}{2}$ in. and less, exclusive of welds joining nozzles or penetrations with an I.D. greater than 2 in.	$1\frac{1}{4}$ in. or less Over $1\frac{1}{4}$ in. to $1\frac{1}{2}$ in. $\frac{3}{4}$ in. or less Over $\frac{3}{4}$ in. to $1\frac{1}{2}$ in.	0.30 or less 0.30 or less Over 0.30 Over 0.30	... 200 ... 200
	All fillet, partial penetration, and repair welds in material over $1\frac{1}{2}$ in., exclusive of welds joining nozzles or penetrations with an I.D. greater than 2 in.	$\frac{3}{4}$ in. or less	...	200
	All welds, including repair welds, in material greater than $1\frac{1}{2}$ in. but equal to or less than $1\frac{3}{4}$ in. [Note (2)]	$1\frac{3}{4}$ in. or less	0.24	200
	All welds joining nozzles or penetrations with a nominal I.D. of 2 in. and less	$\frac{3}{4}$ in. or less	...	200
	Repairs to welds in subassemblies postweld heat treated as required by CC-4552.2.1, with the total accumulated repair length of any weld not exceeding 25% of the original weld length	$\frac{3}{4}$ in. or less	...	200

NOTES:

(1) The exemptions shown in this Table do not apply to electron beam welds in ferritic materials over $\frac{1}{8}$ in. in thickness.

(2) This exemption is limited to SA-299, SA-516, and SA-537 under the following conditions:

(a) the impact test temperature is 40°F below the lowest service temperature;

(b) the C_v energy value is increased by 5 ft-lb over that shown in Table CC-2524.2-2;

(c) exemption from impact testing as provided in CC-2521.1-1 is

**TABLE CC-4552-3
ALTERNATIVE PWHT TEMPERATURES**

Alternative Holding Temperature Range, °F	Alternative Minimum [Note (1)] Holding Time, hr/in. Thickness
1050–1200	2
1000–1150	3
950–1000	5
900–1050	10

NOTE:

(1) All other requirements of CC-4552.2 shall apply.

TABLE CC-4552-3 ALTERNATIVE PWHT TEMPERATURES

CC-4552.4 Methods of PWHT.

The PWHT shall be performed in accordance with the requirements of one of the following subparagraphs.

CC-4552.4.1 Furnace Heating - One Heat.

Heating the item in a closed furnace in one heat is the preferred procedure and should be used whenever practical. The furnace atmosphere shall be controlled so as to avoid excessive oxidation; direct impingement of flame on the component or assembly is prohibited.

Page 124

CC-4552.4.2 Furnace Heating - More Than One Heat.

The item may be heated in more than one heat in a furnace, provided the furnace atmosphere control requirements of CC-4552.4.1 apply and the overlap of the heated sections of the item is at least 5 ft (1.5 m). When this procedure is used, the portion of the item outside the furnace shall be shielded so that the temperature gradient is not harmful. The cross section where the item projects from the furnace shall not intersect a nozzle or other structural discontinuity.

CC-4552.4.3 Local Heating.

Welds may be locally postweld heat treated when it is not practical to heat treat the entire item. Local PWHT shall consist of heating a circumferential band at temperatures within the ranges specified in Table CC-4552-1 or Table CC-4552-3. The width of the controlled band at each side of the weld, on the face of greatest weld width, shall be not less than the thickness of the weld or 2 in., whichever is less. The temperature of the item shall be gradually diminished from the edge of the controlled band outward so as to avoid harmful thermal gradients. This procedure

diminished from the edge of the controlled band outward so as to avoid harmful thermal gradients. This procedure may also be used for PWHT after repairs.

CC-4552.4.4 Heating Components Internally.

The item may be heated internally by appropriate means and with adequate indicating and recording temperature devices to aid in the control and maintenance of a uniform distribution of temperature in the vessel. Previous to this operation, the item shall be fully enclosed with insulating material.

CC-4553 Intermediate PWHT

The temperature, time at temperature, and heating and cooling rate requirements of CC-4552 are not mandatory for intermediate heat treatments.

CC-4554 Heat Treatment After Repairs by Welding

CC-4554.1 Rules Governing Heat Treatment After Repair by Welding.

Liners or portions of liners, including materials that have been repaired by welding, shall be postweld heat treated in accordance with the requirements of CC-4552.

CC-4555 Heat Treatment During Fabrication

When material is subjected to heat treatment during fabrication, the test specimens required by the applicable SA material specification shall be obtained from the sample coupons which have been heat treated in the same manner as the material, including such heat treatments as were applied by the producer before shipment. The required tests may be performed by the material producer or the Fabricator or Constructor. When plate specification heat treatments are not performed by the mill, they shall be performed by or under the control of the Fabricator or Constructor, who shall then place the letter "T" following the letter "G" in the mill plate marking (SA-20) to indicate that the material specification heat treatments have been performed. The Fabricator or Constructor shall also show by a supplement to the appropriate Certified Material Test Report that the specified heat treatment has been performed.

CC-4560 PROTECTION OF ATTACHMENTS

All attachments and penetrations shall be protected against entry of deleterious materials or dislodgement during construction operations.

CC-4600 FABRICATION OF EMBEDMENT ANCHORS

CC-4610 GENERAL REQUIREMENTS

CC-4611 Introduction

- (a) The rules in the following paragraphs apply specifically to the fabrication and construction of embedment anchors.
- (b) Each Certificate Holder shall be responsible for the quality of the welding done by his organization, and shall conduct tests of the welding procedure to determine its suitability and also of the welders and welding operators to determine their ability to apply the procedure properly.
- (c) No production work shall be undertaken until both the welding procedure and the welders or welding operators have been qualified in accordance with Section IX.

CC-4612 Elimination and Repair of Defects

CC-4612.1 Repair of Material.

Material originally accepted on delivery in which defects exceeding the limits of CC-2730 are known or discovered during the process of fabrication or installation is unacceptable. The material may be used provided the condition is

- (a) the limitation on the depth of the weld repair does not apply; and
- (b) the time of examination of the weld repairs to weld edge preparations shall be in accordance with CC-5500.

CC-4620 FORMING, FITTING, AND ALIGNING

CC-4621 Cutting, Forming, and Bending

CC-4621.1 Cutting.

Cutting of material shall be in accordance with CC-4521.1.

CC-4621.2 Forming and Bending Processes.

Forming and bending processes shall be in accordance with CC-4521.2.

CC-4621.3 Qualification of Forming Processes and Acceptance Criteria for Formed Material.

Qualification of forming and bending processes shall be in accordance with CC-4521.3.

CC-4621.4 Minimum Thickness of Fabricated Material.

If any fabrication operation reduces the thickness below the minimum required to satisfy the rules of CC-3000, the material may be repaired in accordance with CC-4612.

CC-4622 Forming Tolerances

CC-4622.1 Tolerances for Embedment Anchors.

Tolerances for embedment anchors shall be specified in the Design Specifications.

CC-4623 Fitting and Aligning

CC-4623.1 Fitting and Aligning Methods.

Parts that are to be joined may be fitted, aligned, and retained in position during the joining operation by the use of bars, jacks, clamps, drift pins, tack welds, or temporary attachments. Mechanical devices shall be carefully used to avoid damage to surfaces of the parts and to avoid enlargement of bolt holes.

CC-4623.1.1 Tack Welds.

Tack welds used to secure alignment shall either be removed completely, when they have served their purpose, or their stopping and starting ends shall be properly prepared by grinding or other suitable means so that they may be satisfactorily incorporated into the final weld. Tack welds shall be made by qualified welders using qualified welding procedures. When tack welds are to become part of the finished weld, they shall be visually examined and defective tack welds removed.

CC-4623.1.2 Temporary Attachments and Their Removal.

Attachments which are welded onto the embedment anchors or parts during the process of manufacture or installation but which are not incorporated into the final support are permitted provided the requirements of (a) through (e) below are met.

- (a) The material is identified and is suitable for welding but need not be certified material.
- (b) The material is compatible for welding to the embedment anchor material to which it is attached.

- (c) The welding material is compatible with the base material and is certified in accordance with CC-2130.
- (d) The welder and welding procedure are qualified in accordance with CC-4532.
- (e) The temporary attachment is completely removed in accordance with the procedures of CC-4621.1.

CC-4623.2 Maximum Offset of Aligned Sections.

Alignment of butt joints shall be such that the maximum offset of the finished weld will not be greater than the applicable amount listed in Table CC-4523-1, where t is the nominal thickness of the thinner section of the joint.

CC-4623.2.1 Fairing of Offsets.

Any offset within the allowable tolerance of Table CC-4523-1 shall be blended uniformly over the width of the finished weld or, if necessary, by adding additional weld metal beyond what would otherwise be the edge of the weld.

CC-4630 WELDING QUALIFICATIONS

CC-4631 General Requirements

CC-4631.1 Types of Processes Permitted.

Only those welding processes which are capable of producing welds in accordance with the welding procedure qualification requirements of Section IX and this Subsection shall be used for welding embedment anchor material or attachments thereto. Any process used shall be such that the records required by CC-4632 can be prepared, except that records for stud welds shall be traceable to the welders and welding operators and not necessarily to each specific weld.

CC-4631.1.1 Stud Welding.

Stud welding shall be in accordance with CC-4543.5.

CC-4632 Welding Qualification and Records

CC-4632.1 Required Qualifications

(a) Each Certificate Holder is responsible for the welding done by his organization and shall establish the procedure and conduct the test required by this

Page 126

Article and Section IX in order to qualify both the welding procedures and the performances of welders and welding operators who apply these procedures.

(b) Procedures, welders, and welding operators used to join permanent or temporary attachments to embedment anchors and to make permanent or temporary tack welds used in such welding shall also meet the qualification requirements of this Article.

(c) When making procedure test plates for butt welds, consideration shall be given to the effect of angular, lateral, and end restraint on the weldment. The addition of restraint during welding may result in cracking difficulties that otherwise might not occur.

CC-4632.2 Maintenance and Certification of Records.

Maintenance and certification of records shall be in accordance with CC-4532.2.

CC-4632.2.1 Identification of Joints

(a) For partial penetration welds with a depth less than 1 in., fillet welds with a throat dimension less than 1 in., and stud welds, the Certificate Holder need not identify the welder or welding operator who welded each joint provided:

(1) the Certificate Holder maintains a system that will identify the welders or welding operators who made such welds so that the Inspector can verify that the welders or welding operators were all properly qualified;

(2) the welds in each category are all of the same type and configuration and are welded with the same Welding Procedure Specification;

(b) the identification of welder or welding operator is not required for tack welds;

(c) the Certificate Holder shall certify that only welders and welding operators qualified in accordance with CC-4632.1 and Section IX were used in making all welds.

CC-4632.3 Welding Prior to Qualification.

No welding shall be undertaken until after the welding procedures which are to be used have been qualified.

CC-4632.4 Transferring Qualifications.

The welding procedures qualification and the performance qualification tests for welders and welding operators conducted by one Certificate Holder shall not qualify welding procedures and shall not qualify welders or welding operators to weld for any other Certificate Holder, except as provided in Section IX, QW-201 and QW-300.2.

CC-4633 General Requirements for Welding Procedure Qualification Test

The requirements for welding procedure qualification tests shall be in accordance with CC-4533.

CC-4634 Continuing Performance Test for Stud Welding

Continuing performance test for stud welding shall be in accordance with CC-4534.

CC-4640 RULES GOVERNING MAKING, EXAMINING, AND REPAIRING WELDS

CC-4641 Precautions to Be Taken Before Welding

Precautions to be taken before welding shall be in accordance with CC-4541.

CC-4642 Rules for Making Welded Joints

CC-4642.1 Welded Joints.

The materials for backing strips, when used, shall be compatible with the base metal. Backing strips shall be continuous and any joints shall be made with full penetration welds.

CC-4642.2 Peening.

The weld metal may be peened when it is deemed necessary or helpful to control distortion. Peening is prohibited on root pass and final pass.

CC-4642.3 Double-Welded Joints.

Before applying weld metal on the second side to be welded, the root of full penetration double-welded joints shall be prepared by suitable methods, such as chipping, grinding, or thermal gouging to sound metal except for those processes of welding by which proper fusion and penetration are otherwise obtained and demonstrated to be satisfactory by welding procedure qualification.

CC-4642.4 Surfaces of Welds.

As-welded surfaces are permitted. However, the surfaces of welds shall be sufficiently free from coarse ripples, grooves, overlaps, abrupt ridges, and valleys to meet the requirements of (a) through (e) below.

(a) The surface condition of the finished weld shall be suitable for the proper interpretation of radiographic and other required nondestructive examinations of the welds. In those cases where there is a question regarding the surface condition on the interpretation of a radiographic film, the film shall be compared to the actual

Page 127

weld surface for interpretation and determination of acceptability.

(b) Reinforcements are permitted in accordance with CC-4642.5.

(c) Undercuts shall not exceed $\frac{1}{32}$ in. (0.8 mm).

(d) Concavity on the root side of a single welded circumferential butt weld is permitted when the resulting thickness of the weld is at least equal to the thickness of the thinner member of the two sections being joined.

(e) If the surface of the weld required grinding to meet the above criteria, care shall be taken to avoid reducing the weld or base material below the required thickness.

CC-4642.5 Reinforcement of Butt Welds.

The surface of the reinforcement of all butt welded joints may be flush with the base material or may have uniform crowns. The height of reinforcement on each face of the weld shall not exceed the following thickness:

Nominal Thickness, in.	Maximum Reinforcement, in.
Up to 1, incl.	$\frac{3}{32}$
Over 1 to 2, incl.	$\frac{1}{8}$
Over 2 to 3, incl.	$\frac{5}{32}$
Over 3 to 4, incl.	$\frac{7}{32}$
Over 4 to 5, incl.	$\frac{1}{4}$
Over 5	$\frac{5}{16}$

CC-4642.6 Shape and Size of Fillet Welds.

Fillet welds may vary from convex to concave. The size of the weld shall be in accordance with the requirements of Fig. CC-4542-1. A fillet weld in any single continuous weld may be less than the specified fillet weld dimension by not more than $\frac{1}{16}$ in. (1.6 mm), provided that the total undersize portion of the weld does not exceed 10% of the length of the weld. Individual undersize weld portions shall not exceed 2 in. (51 mm) in length. On web-to-flange welds on girders, no underrun is permitted at the ends for a length equal to twice the width of the flange. In making fillet welds, the weld metal shall be deposited in such a way that adequate penetration into the base metal at the root of the weld is secured.

CC-4642.7 Plug Welds.

When plug welds are used on embedment anchors, a fillet weld shall first be deposited around the circumference at the bottom of the hole.

CC-4642.8 Stud Welding.

Stud welding shall be in accordance with the requirements of CC-4543.5.

CC-4644 Examination of Welds

All welds shall be examined in accordance with the requirements of CC-5500.

CC-4645 Repair of the Weld Metal Defects

Repair of weld metal defects shall be in accordance with CC-4545.

CC-4650 HEAT TREATMENT

Heat treatment of concrete embedment material shall be in accordance with CC-4550.

CC-4660 BOLTED CONSTRUCTION

Requirements for bolted construction shall be defined in the Construction Specification.

July 1, 1998

American Society Of Mechanical Engineers

SEC III D2 CC-5000

ARTICLE CC-5000 CONSTRUCTION TESTING AND EXAMINATION

Page 129

CC-5100 GENERAL REQUIREMENTS FOR EXAMINATION

CC-5110 PROCEDURES, QUALIFICATION, AND EVALUATIONS

CC-5111 General Requirements

Nondestructive examinations, except vacuum box examination, shall be in accordance with the examination procedures of Section V. Vacuum box examination shall be in accordance with Appendix IX. For radiography, geometric unsharpness shall not exceed the limits of T-285 of Section V. The examinations shall be performed by personnel who have been qualified as required in this Article. The results of the examinations shall be evaluated in accordance with the acceptance standards of this Article. The examination of parts and appurtenances meeting the requirements for Class MC and which are not backed up by concrete for load carrying purposes shall meet the requirements of NE-5000 and Subsection NCA. Examination of embedded attachments to parts examined to the requirements of Division 1 shall meet the requirements of this Article.

CC-5112 Nondestructive Examination Procedures

All nondestructive examinations required by this Article shall be performed in accordance with detailed written procedures, which have been proven by actual demonstration, to the satisfaction of the Inspector. The procedures shall comply with the appropriate Article of Section V and this Subsection for the particular examination method. Special configurations and materials may require modified methods and techniques. In these cases, special procedures which are at least equivalent to the methods and techniques described in Section V shall be developed. Written procedures and records of demonstration of procedure capability and personnel qualification shall be made available to the Inspector upon request. At least one copy of each procedure shall be readily available to all appropriate nondestructive examination personnel for reference and use.

CC-5113 Post-Examination Cleaning

Following any nondestructive examination in which examination materials are applied to the piece, the piece shall be thoroughly cleaned in accordance with procedure specifications.

CC-5120 QUALIFICATION AND CERTIFICATION OF NONDESTRUCTIVE EXAMINATION PERSONNEL

CC-5121 General Requirements

Organizations performing Code required nondestructive examinations shall use personnel competent and knowledgeable

to the degree specified by CC-5122. When these services are subcontracted by the Certificate Holder or Quality System Certificate Holder, he shall verify the qualification of personnel to the requirements of CC-5122. All nondestructive examinations required by this Subsection shall be performed by and the results evaluated by qualified nondestructive examination personnel.

CC-5122 Personnel Qualification, Certification, and Verification

CC-5122.1 Qualification Procedure

(a) Personnel performing nondestructive examinations shall be qualified in accordance with the recommended

Page 132

guidelines of SNT-TC-1A.¹² The Employer's³ written practice required by paragraph 5 of SNT-TC-1A shall identify his requirements relative to the recommended guidelines. The recommended guidelines of SNT-TC-1A shall be considered minimum requirements, except as modified in (1) through (5) below.

(1) Qualification of Level III nondestructive examination personnel shall be by examination.

(a) The basic and method examinations, paragraphs 8.3.3(1) and 8.3.3(2) of SNT-TC-1A, may be prepared and administered by the Employer, ASNT, or an outside agency.

(b) The specific examination, paragraph 8.3.3(3) of SNT-TC-1A, shall be prepared and administered by the Employer or an outside agency. The Employer or outside agency administering the specific examination shall identify the minimum grade requirement in the written program when the basic and method examinations have been administered by ASNT, which issues grades on a pass/fail basis. In this case, the minimum grade for the specific examination may not be less than 80%.

(2) The written practice identified in paragraph 5 of SNT-TC-1A and the procedures used for examination of personnel shall be referenced in the Employer's Quality Program.

(3) The number of hours of training and experience for nondestructive examination personnel who perform only one operation of a nondestructive examination method that consists of more than one operation, or perform nondestructive examination of limited scope, may be less than that recommended in Table 6.3.1 of SNT-TC-1A. The training and experience times shall be described in the written practice, and any limitations or restrictions placed on the certification shall be described in the written practice and on the certificate.

(4) For visual examination, the Jaeger Number 1 letters shall be used in lieu of the Jaeger Number 2 letters specified in paragraph 8.1.1(1) of SNT-TC-1A. The use of equivalent type and size letters is permitted.

1 SNT-TC-1A is a Recommended Practice for Nondestructive Testing Personnel Qualification and Certification published by the American Society for Nondestructive Testing, 4153 Arlington Plaza, Columbus, Ohio 43221. SNT-TC-1A-1980 is the applicable edition.

2 Personnel qualified by examination and recertified to the 1975 edition are considered to be qualified to the 1980 edition when the recertification is based on continuing satisfactory performance. All reexaminations and new examinations shall be in accordance with the 1980 edition.

3 Employer as used in this Article shall include: N Certificate Holders; Quality System Certificate Holders; Material Manufacturers and Material Suppliers who are qualified in accordance with NCA-3862(a)(1); and organizations who provide subcontracted nondestructive examination services to organizations described above.

(5) A Level I individual shall be qualified to perform specific setups, calibrations, and tests, and to record and evaluate data by comparison with specific acceptance criteria defined in written instructions. The Level I individual shall implement these written NDE instructions under the guidance of a Level II or III individual. A Level I individual may independently accept the results of nondestructive examinations when the specific acceptance criteria are defined in the written instructions.

(b) For nondestructive examination methods not covered by SNT-TC-1A documents, personnel shall be qualified to comparable levels of competency by subjection to comparable examinations on the particular method involved.

(c) The emphasis shall be on the individual's ability to perform the nondestructive examination in accordance with the applicable procedure for the intended application.

(d) For nondestructive examination methods that consist of more than one operation or type, it is permissible to use

personnel qualified to perform one or more operations. As an example, one person may be used who is qualified to conduct radiographic examination and another may be used who is qualified to interpret and evaluate the radiographic film.

CC-5122.2 Certification of Personnel

(a) The Employer retains responsibility for the adequacy of the program and is responsible for certification of Levels I, II, and III nondestructive examination personnel.

(b) When ASNT is the outside agency administering the Level III basic and method examinations CC-5122.2(a)(2), the Employer may use a letter from ASNT as evidence on which to base the certification.

(c) When an outside agency is the examining agent for Level III qualification of the Employer's personnel, the examination results shall be included with the Employer's record.

CC-5122.3 Verification of Nondestructive Examination Personnel Certification.

The Certificate Holder has the responsibility to verify the qualification and certification of nondestructive examination personnel employed by Material Manufacturers and Material Suppliers and qualified by them in accordance with NCA-3820 and subcontractors who provide nondestructive examination services to them.

CC-5122.4 Records.

Personnel qualification records identified in paragraph 9.6.1 of SNT-TC-1A shall be retained by the Employer.

Page 133

CC-5130 QUALIFICATION OF CONCRETE INSPECTION AND TESTING PERSONNEL

CC-5131 General Requirements

It shall be the responsibility of each organization (NCA-3000) to ensure that all personnel performing concrete inspection and testing functions under this Division are competent and knowledgeable of the applicable requirements to the degree specified in CC-5132. All concrete inspection and testing required by this Division shall be performed and the results evaluated by qualified concrete inspection and testing personnel. The assignment of responsibilities to individual personnel will be at the discretion of the responsible organization.

CC-5132 Personnel Qualification

Personnel performing concrete inspection and testing functions shall be qualified in accordance with Appendix VII of this Division.

CC-5133 Verification by Authorized Inspectors

The Authorized Inspector has the duty to verify the organization's certification of concrete inspection and testing personnel in accordance with Appendix VII, and has the prerogative to audit the program and require requalification of any concrete inspection and testing personnel when the Authorized Inspector has reason to question the performance of that individual.

CC-5140 RECORDS

Personnel qualification records shall be retained in accordance with NCA-4134.17.

CC-5200 CONCRETE EXAMINATION

CC-5210 GENERAL

Concrete and concrete constituents shall be examined and tested in accordance with the rules established herein. The results of these tests shall not represent constituents previously used, but will be used only to qualify or disqualify the lot of

concrete constituents represented. The examinations and tests required by this Subarticle shall be performed by the Constructor, Fabricator, or Manufacturer of Nonmetallic Materials and monitored by the Authorized Inspector in accordance with NCA-5000. If the examinations and tests are performed by the Manufacturer of Nonmetallic Materials, provisions shall be made for the Authorized Inspector of the Constructor or Fabricator, as applicable, to make the necessary inspections to ensure compliance with this Subarticle. The results shall be verified by the Fabricator or Constructor.

CC-5211 Laboratory Qualification

The tests required by CC-5200 shall be performed by an accredited laboratory that complies with ASTM C 1077, Standard Practice for Testing Concrete and Concrete Aggregates for Use in Construction and Criteria for Laboratory Evaluation, except that testing personnel shall be qualified in accordance with CC-5132.⁴

CC-5220 CONCRETE CONSTITUENTS

CC-5221 Cement

CC-5221.1 Requirements.

Quality control testing shall be performed by the Constructor to ascertain conformance with the applicable requirements of ASTM C 150, or ASTM C 595, as shown in Table CC-5200-1.

CC-5221.2 Testing Frequency.

The frequency of testing shall be as shown in Table CC-5200-1.

CC-5222 Admixtures

CC-5222.1 Air-Entraining Admixtures

CC-5222.1.1 Requirements.

In addition to the testing required by ASTM C 260 of the admixture Manufacturer, the following quality control tests shall be performed using procedures recommended by the Manufacturer: infrared analysis, pH, and solids content. Additionally, the optional uniformity requirements of ASTM C 260 shall apply - pH, specific gravity, and air content.

CC-5222.1.2 Testing Frequency.

Quality control tests shall be conducted on the air-entraining admixture prior to use in accordance with Table CC-5200-1.

CC-5222.2 Mineral Admixtures (Fly Ash and Pozzolan)

⁴ Such laboratory inspections can be provided by the Cement and Concrete Reference Laboratory (CCRL) of the National Institute of Standards and Technology, with accreditation programs provided by the National Voluntary Laboratory Accreditation Program (NVLAP), American Association for Laboratory Accreditation (AALA), and American Materials Engineering Council (CEMC).

CC-5222.2.1 Requirements.

Quality control testing shall be performed to ascertain conformance with

Page 134

Page 137

the applicable requirements of ASTM C 618, as shown in Table CC-5200-1. Pages 135-136

**TABLE CC-5200-1
MINIMUM TESTING FREQUENCIES FOR CONCRETE CONSTITUENTS AND CONCRETE**

Material	Requirements	Test Method	Frequency [Note (1)]	
			Initial [Note (2)]	After Field Experience [Note (3)]
Cement	Standard chemical properties	ASTM C 114	Each 1200 tons	Each 1200 tons
	Fineness	ASTM C 204 or ASTM C 115	Each 1200 tons	Each 1200 tons
	Autoclave expansion	ASTM C 151	Each 1200 tons	Each 1200 tons
	Compressive strength	ASTM C 109	Each 1200 tons	Each 1200 tons
	Time of setting	ASTM C 266 or ASTM C 191	Each 1200 tons	Each 1200 tons
Air-Entraining Admixtures	Uniformity	Infrared spectrophotometry, pH, and solids content in accordance with ASTM C 260	Composite of each shipment or production lot	Composite of each shipment or production lot
Mineral Admixtures (Fly Ash and Pozzolans)	Loss on ignition	ASTM C 311	Each 400 tons	Each 400 tons
	Fineness (No. 325 sieve analysis)	ASTM C 311	Each 400 tons	Each 400 tons
	Specific gravity	ASTM C 311	Each 400 tons	Each 400 tons
	Reactivity with cement alkalies [Note (4)]	ASTM C 441	Each 2000 tons	Each 2000 tons
	Available alkalies [Note (4)]	ASTM C 311	Each 2000 tons	Each 2000 tons
Chemical Admixtures	Uniformity	Infrared analysis, specific gravity (liquids singly), and residue by oven drying in accordance with ASTM C 494	Composite of each shipment or production lot	Composite of each shipment or production lot

General Purpose Grout				

TABLE CC-5200-1 (CONT'D)

NOTES:

- (1) Testing frequencies on a time basis apply only during production and placement of concrete or grout and when the constituent is being used.
- (2) Initially during the development of the first 30 tests of production concrete and whenever the criteria for the alternate frequency [Note (3)] cannot be met.
- (3) Whenever the average strength f_{cr} of the latest 30 consecutive compressive strength test results exceeds the specified strength f'_c by an amount expressed as $f_{cr} = f'_c + 1.419 (f'_c/8.69)$.
- (4) If required by the Construction Specification.
- (5) Not required for crushed stone quarried from rock strata unless petrographic analysis indicates acceptable but significant quantities of these contaminants.
- (6) The chloride content of the concrete shall be calculated in accordance with CC-5231.
- (7) The report shall be evaluated by the Designer.
- (8) Test frequencies apply to each concrete mix design placed each day.

TABLE CC-5200-1 (CONT'D)

CC-5222.2.2 Testing Frequency.

The frequency of testing shall be as shown in Table CC-5200-1.

CC-5222.2.3 Uniformity Requirements.

The quality control testing results of CC-5222.2.1 shall be evaluated to ascertain conformance with the ASTM C 618 uniformity requirements for:

(a) specific gravity; and

(b) fineness.

CC-5222.3 Chemical Admixtures

CC-5222.3.1 Requirements.

In addition to the testing required of the admixture Manufacturer by ASTM C 494, the following quality control tests shall be performed using procedures recommended by the Manufacturer and as stipulated in ASTM C 494 to assure uniformity: infrared analysis, specific gravity (liquids singly), and residue by oven drying.

CC-5222.3.2 Testing Frequency.

Quality control tests shall be conducted on the admixture prior to use in accordance with Table CC-5200-1.

CC-5222.4 Grout Fluidifier

CC-5222.4.1 Requirements.

Quality control testing shall be performed to ascertain conformance to ASTM C 937.

CC-5222.4.2 Testing Frequency.

Quality control tests shall be conducted on the fluidifier in accordance with Table CC-5200-1.

CC-5223 Aggregates

CC-5223.1 Requirements.

Quality control tests shall be as shown in Table CC-5200-1. Aggregate samples for gradation, moisture content, and material finer than #200 sieve tests shall be obtained from conveyors, bins, or chutes at the batch plant. Aggregate samples for other quality control tests may be obtained from these same locations, at the point of delivery, or from stockpiles.

If the aggregate sampled for gradation and materials finer than #200 sieve tests are not within the specification limits, two additional samples shall be obtained from the same location and tested. If both of the retest samples are within specification limits, the aggregate is acceptable. If either or both of the retest samples is outside of the specification limits, the three test results shall be averaged. This test result shall be averaged with the previous five aggregate test results. If the average of the six tests is within specification limits, the remaining aggregate is acceptable. If the average of the six tests is outside specification limits, the remaining aggregate shall be adjusted to bring the aggregate within limits or the aggregate shall be rejected.

If the aggregate sampled for the other quality control tests is outside the specification limits, two additional aggregate samples shall be obtained from the same location and tested. If both samples are within the specification limits, the aggregate is acceptable.

CC-5223.2 Testing Frequency.

The frequency of testing shall be as shown in Table CC-5200-1.

CC-5224 Mixing Water

CC-5224.1 Requirements.

Quality control testing shall be performed to ensure conformity with the requirements of CC-2223.

CC-5224.2 Testing Frequency.

The frequency of testing shall be as shown in Table CC-5200-1.

CC-5230 CONCRETE

CC-5231 Mixer Uniformity

Mixer uniformity tests shall be performed on stationary and truck mixers to determine that the mixers are capable of combining the concrete constituents into a thoroughly mixed and uniform mass.

CC-5231.1 Requirements.

Mixer uniformity shall be established in accordance with ASTM C 94.

CC-5231.2 Testing Frequency.

The frequency of testing shall be as shown in Table CC-5200-1.

CC-5232 Concrete Properties

(a) Concrete slump, temperature, air content, unit weight, and physical properties examination shall be performed on a common sample to establish conformance with the provisions of the Construction Specification. The sampling of freshly mixed concrete for the above tests shall be in accordance with ASTM C 172, Sampling Fresh Concrete. This sampling shall take place after all material and water additions have been made.

(b) The chloride content of the concrete shall be calculated and evaluated each time chloride test results are received on any one of the constituents. The calculation shall be based on the most recent chloride test results of the other constituents.

Page 138

CC-5232.1 Slump

CC-5232.1.1 Requirements.

Quality control testing in accordance with ASTM C 143, Slump of Portland Cement Concrete, shall be performed to ensure conformity to the requirements of the Construction Specification.

CC-5232.1.2 Testing Frequency.

The frequency of testing shall be as shown in Table CC-5200-1.

CC-5232.2 Temperature, Air Content, and Unit Weight

CC-5232.2.1 Requirements.

Temperature, air content, and unit weight shall be measured to ensure conformance with the Construction Specification. Air content tests shall be made in accordance with ASTM C 173, Test for Air Content of Freshly Mixed Concrete by the Volumetric Method, or ASTM C 231, Test for Air Content of Freshly Mixed Concrete by the Pressure Method. Unit weight tests shall be made in accordance with ASTM C 138, Method of Test for Weight per

Cu. Ft., Yield, Cement Factor, and Air Content (Gravimetric) of Concrete.

CC-5232.2.2 Testing Frequency.

The frequency of testing shall be as shown in Table CC-5200-1.

CC-5232.2.3 Evaluation and Acceptance.

The concrete is acceptable if no more than one individual air content test result in a placement is outside the specified range of air content by more than 20%, provided the average of all air content test results in each placement is within the limits specified in Table CC-2232.3.1.

CC-5232.3 Physical Properties

CC-5232.3.1 Requirements.

Testing of concrete physical properties shall be performed for the purpose of establishing conformance with the provisions of the Construction Specification.

CC-5232.3.2 Evaluation and Acceptance

(a) Samples for compressive strength tests of each class of concrete shall be taken at the frequency of testing shown in Table CC-5200-1. Concrete for compressive strength tests shall be sampled in accordance with ASTM C 172. Cylinders for acceptance tests shall be molded and laboratory cured in accordance with ASTM C 31, Standard Method of Making and Curing Test Specimens in the Field, and tested in accordance with ASTM C 39. Each strength test result shall be the average of two or more cylinders made from the same sample tested at 28 days or other age "a" days when specified in the Design Documents.

(b) When the frequency of testing will provide less than five tests for a given concrete mix for the containment, tests shall be made from at least five randomly selected batches, or from each batch if fewer than five are used.

(c) The strength level of the concrete will be considered satisfactory if the averages of all sets of three consecutive strength tests at "a" days equal or exceed the specified strength and no individual strength test result falls below the specified strength by more than 500 psi.

(d) Supplementary compressive strength tests may be required to check the adequacy of curing and to determine form removal time. When such strength tests are required, the specimens shall be molded and cured under field conditions in accordance with ASTM C 31 and tested in accordance with ASTM C 39. Such specimens shall be molded at the same time and from the same batch as the laboratory cured acceptance test specimens. Procedures for protecting and curing the concrete in the structure shall be improved when the strength of field cured cylinders at "a" days is less than 85% of that of the companion laboratory cured cylinders. When the laboratory cured cylinder strengths are appreciably higher than the specified strengths, the field cured cylinder strengths need not exceed the specified strength by more than 500 psi (3.4 MPa) even though the 85% criterion is not met.

(e) If verification of tensile strength is required, eight sets of four test specimens shall be prepared for each type of concrete throughout the period of construction. They shall be molded and laboratory cured in accordance with ASTM C 31 and tested at "a" days in accordance with ASTM C 78, Flexure Strength of Concrete (Using Simple Beam with Third Point Loading), or ASTM C 496, Test for Splitting Tensile Strength of Cylindrical Concrete Specimens. For each set, three specimens shall be tested for flexure or splitting tensile strength and one for compression.

(f) If the test results do not satisfy the acceptance criteria, the Constructor or Fabricator shall prove to the satisfaction of the Designer that the load carrying capacity of the structure is not jeopardized. If the possibility of low strength concrete is confirmed and computations indicate that the load carrying capacity may have been significantly reduced, test of cores drilled from the area in question may be required in accordance with ASTM C 42, Standard Method of Obtaining and Testing Drilled Cores and Sawed Beams of Concrete. Three cores shall be taken for each case of a cylinder test more than 500 psi (3.4 MPa) below the specified strength.

(g) Concrete in the area represented by the core will be considered structurally adequate if the average of the three strength values is equal to at least 85% of specified strength and if no single core is less than 75% of specified strength. To check testing accuracy, locations represented by the erratic core strengths may be retested. If the strength acceptance criteria are not met by the retests and if structural adequacy remains in doubt, the nonconforming concrete must be replaced. The structural adequacy shall be determined by the Designer.

CC-5233 Preplaced Aggregate Concrete

CC-5233.1 Aggregate

(a) Tests for cleanliness, in accordance with ASTM C 117, and gradation, in accordance with ASTM C 136, shall be performed for each 200 tons (181,000 kg) of aggregate placed in the forms.

(b) Visual examination of aggregate for cleanliness shall be maintained while washing, transporting, and placing aggregate.

CC-5233.2 Cement, Mineral Filler, and Fluidifier

(a) Material shall be tested in accordance with CC-5220.

(b) Grout fluidifier shall be tested in accordance with ASTM C 937. In addition, the grout fluidifier shall be certified by the Constructor, Fabricator, Nonmetallic Material Manufacturer, or Nonmetallic Constituent Supplier to possess the same physical and chemical properties as the grout fluidifier developed and used in trial mix tests.

CC-5233.3 Intrusion Grout

(a) The viscosity of each batch of intrusion grout shall be determined in accordance with ASTM C 939 (flow cone method). The Construction Specification shall establish the flow factor units to be used as the basis for acceptance, rejection, and adjustment of each grout batch mix.

(1) Prior to transferring grout from the mixer to the agitator (if no intermediate agitation is planned prior to pumping), at least one flow cone test for each mix shall fall within the specified limits. Grout not meeting the specified flow factors shall not be transferred to the agitator.

(2) During agitation, if the grout is stiffening, a flow cone test shall be performed just prior to pumping. If the flow cone test result falls outside the specified flow factor limits, the grout batch shall be discarded. Each flow cone test result shall be recorded and its time verified.

(b) The temperature of each grout batch shall be measured at the mixer, at the agitator, and after the grout has left the pump at the point of injection, and recorded. If the temperature of the grout at the place of entering the form is outside of the specified limits for more than one in five consecutive batches, corrective measures shall be taken.

(c) Expansion and bleeding tests shall be performed on a grout sample taken from an actual batch just prior to pumping in accordance with ASTM C 940, Test for Expansion of Grout Mixtures, as modified by the Construction Specification. Expansion and bleeding tests shall be made for each grout batch from which test cylinders are taken.

(d) The time of set shall be determined on a grout sample taken from an actual batch just prior to pumping in accordance with ASTM C 953, Test for Time of Setting of Grout Mixtures, or as modified by the Construction Specification.

CC-5233.4 Concrete.

For each preplaced aggregate concrete placement, test cylinders shall be fabricated from each specified batch or each 100 cu yd of grout, or fraction thereof, pumped during the grouting operation. The number of test cylinders and their test age shall be as specified in the Construction Specification. The 6 in. × 12 in. (152 mm × 305 mm) heavy-duty test cylinder molds and casting procedures shall conform to the requirements of ASTM C 943. Cylinders shall be moist-cured in accordance with ASTM C 31 until tested in accordance with ASTM C 39.

CC-5234 General Purpose Grout

CC-5234.1 Constituents

CC-5234.1.1 Requirements.

Quality control tests shall be conducted on grout constituents in accordance with the requirements of CC-5220.

CC-5234.1.2 Test Frequency.

The frequency of testing shall be as shown in Table CC-5200-1.

CC-5234.2 Physical Properties

CC-5234.2.1 Requirements.

Grout shall be tested in accordance with ASTM C 109 or CRD C 621 for the purpose of establishing conformance of compressive strength to the requirements of the construction specifications.

CC-5234.2.2 Test Frequency.

The frequency of testing shall be as shown in Table CC-5200-1.

Page 140

CC-5240 CEMENT GROUT FOR GROUTED TENDON SYSTEMS

CC-5241 General

Grout fluidity or viscosity, bleeding, and compressive strength shall be specified in the Construction Specification and determined on a common sample in accordance with CC-2240.

CC-5242 In-Process Testing Frequencies

CC-5242.1 Temperatures.

Temperature of the air and combined grout constituents shall be measured and recorded hourly during the grouting operation to determine compliance with the Construction Specification.

CC-5242.2 Fluidity/Viscosity.

The fluidity or viscosity of the grout, as appropriate, shall be measured prior to placement of the first batch each day. An additional test shall be made for each 20 subsequent batches but not less than one test for every fourth tendon grouted each day.

CC-5242.3 Compressive Strength.

Grout strength tests consisting of a set of 3 cube specimens shall be made at the rate of one set for each 100 batches of grout, but not less than one set per day. The tests shall be performed in accordance with CRD C 621.

CC-5242.4 Chemical Requirements.

During grouting the amounts of chloride-nitrate in the grout constituents shall be determined weekly for each lot or batch of constituents.

CC-5300 EXAMINATION OF REINFORCING SYSTEMS

CC-5310 GENERAL

This Subarticle describes the requirements for the examination of reinforcing bars and their splices and joints.

CC-5320 EXAMINATION OF MECHANICAL SPLICES

Acceptance criteria for all splicing systems shall be as described in the Construction Specification.

CC-5321 Sleeve With Ferrous Filler Metal Splices

(a) One sleeved connection from each day's work per splicing crew shall be examined daily for proper fit-up.

(b) All completed sleeved connections shall be visually examined after cooling for acceptable bar end locations. Filler metal shall be visible at each accessible end of the splice sleeve and at the tap hole. Each accessible end of the splice sleeve shall also be subjected to the maximum allowable void criteria as described in the Construction Specification. Splices not meeting these criteria shall be removed and replaced.

CC-5322 Taper Threaded Splices

(a) Bar ends and splice sleeves shall be visually examined prior to assembly for cleanliness.

(b) Threads shall be checked with a Manufacturer's thread gage.

(c) Bars shall be marked with a suitable marker to indicate depth of insertion into splice. After assembly, the actual depth of insertion shall be checked for compliance with CC-4333.3 by means of this mark.

(d) Proper assembly and torque shall be checked for compliance with the installation procedure described in the Construction Specification.

(e) One splice of each 100 production splices shall be disassembled, inspected for compliance with CC-4333.3, and all threads rechecked with the Manufacturer's thread gage.

CC-5323 Swaged Splices

(a) Bar ends and splice sleeves shall be visually examined prior to assembly for cleanliness and proper end preparation.

(b) Bars shall be marked with a suitable marker to indicate depth of insertion into splice. After completion, the actual depth of insertion shall be checked for compliance with CC-4333.3 by means of this mark.

(c) Proper assembly and swaging pressure shall be checked for compliance with the installation procedure described in the Construction Specification.

CC-5324 Threaded Splices in Thread Deformed Reinforcing Bar

(a) Bar ends and splice sleeves shall be visually examined for damage, cleanliness, and proper end preparation prior to assembly.

Page 141

(b) Threads shall be checked with a Manufacturer's thread gage.

(c) Bars shall be marked with a suitable marker to indicate depth of insertion into splice. After assembly, the actual depth of insertion shall be checked for compliance with CC-4333.3 by means of this mark.

(d) Proper assembly and torque at both ends of coupling shall be checked for compliance with the installation procedure described in the Construction Specification.

CC-5340 EXAMINATION OF BENDS

The bent or straightened surfaces of all reinforcing bars that are partially embedded in concrete and that are bent and/or straightened in the field shall be visually examined for indications of cracks.

(a) Bars exhibiting transverse cracks or fissures shall be rejected and the bent or straightened section shall be removed and replaced using a splice in accordance with CC-4330.

(b) The presence of longitudinal seams shall not be cause for removal.

CC-5400 EXAMINATION OF PRESTRESSING SYSTEMS

CC-5410 GENERAL

This Subarticle describes the examination requirements for prestressing systems. Aspects of the systems which affect quality such as tendon fabrication, placement and tensioning of tendons, installation of ducts and bearing plates, and the application of the corrosion prevention materials shall be examined.

CC-5420 REQUIRED EXAMINATION

CC-5421 General

The design, fabrication, and installation of pre-stressing systems shall be in conformance with the Construction Specification. The Construction Specification shall include provisions to control and examine tendon length, twist, temporary protective coatings if required, anchorage hardware, conformance to Manufacturer's standards, coiling and packaging requirements, handling, shipping, and storage procedures.

CC-5422 Bearing Plates

CC-5422.1 Preplacement.

Bearing plates shall be examined for dimensional accuracy, out-of-square, and surface smoothness in accordance with the criteria stated in the Construction Specification.

CC-5422.2 Post-Placement.

Following installation, the position of all bearing plates shall be examined prior to concrete placement for proper location and orientation. Placement tolerances shall be in accordance with the Construction Specification. If the orientation of the plate tends to inhibit concrete placement, a program shall be specified in the Construction Specification for the examination of the soundness of the concrete in the bearing zone.

CC-5423 Tendon Ducts

CC-5423.1 Preplacement.

Tendon ducts shall be examined to ensure compliance with requirements of the Construction Specification as to type, diameter, and wall thickness. The frequency of examination shall be specified in the Construction Specification.

CC-5423.2 Post-Placement.

Tendon ducts shall be examined for position and alignment in accordance with CC-4452. After installation, but prior to concrete placement, the ducts shall be visually examined for damage, including holes and cracks, and for dents and ovaling which may affect required minimum clear aperture. The criteria for the visual examination shall be given in the Construction Specification. Prior to and following concrete placement, all ducts shall be examined to ensure that minimum clear aperture is provided.

CC-5424 Prestressing Steel

(a) All tendons shall be examined to verify that proper element quantities are present. The elements shall be examined at the frequency defined in the Construction Specification to verify proper diameter.

(b) The exposed surfaces of the prestressing elements shall be visually examined upon shipping, receipt, and prior to installation to ensure that damage such as nicks, bends, or corrosion has not occurred to a detrimental degree. Criteria for acceptance shall be given in the Construction Specification. Tendons shall be examined for banding and twisting of the bundle to ensure compliance with the field drawings.

CC-5425 Anchorage Components

(a) Anchorage components shall be examined for dimensions, thread, and surface conditions. The frequency of such examinations, as well as tolerance and any other acceptance criteria, shall be in accordance with the Construction Specification.

(b) Following tensioning, all anchorage assemblies shall be visually examined. The total number of rejectable wires, strands, or bars shall not exceed the limit set forth in CC-4465.

CC-5426 Tensioning

The tensioning of tendons shall be examined for conformance with written procedures. The frequency of this examination shall be specified in the Construction Specification.

CC-5500 EXAMINATION OF WELDS**CC-5510 GENERAL****CC-5511 Scope**

This Subarticle contains the nondestructive examination requirements for the welding of liners and attachments thereto.

CC-5512 Time of Examination of Welds

Acceptance examination of welds shall be performed at the times stipulated in (a) through (d) below, except as otherwise specified in CC-5520.

(a) Radiographic examination of all welds in liners may be performed prior to any required postweld heat treatment for P-No.1 material.

(b) Magnetic particle or ultrasonic examinations shall be performed after any required postweld heat treatment, except P-No.1 materials may be examined prior to PWHT.

(c) All dissimilar metal weld joints shall be examined after final postweld heat treatment.

(d) Vacuum box or gas medium examinations shall be performed after any required final PWHT.

CC-5520 REQUIRED EXAMINATION OF WELDS**CC-5521 Welding Categories**

(a) Category A and B welds shall be radiographed in accordance with CC-5531, except where backup bars are used in accordance with CC-4542.1. Category A and B welds with backup bars shall be examined by the magnetic particle or ultrasonic examination method for the full length of the weld.

(b) Category D butt welds shall be examined in accordance with (a) above. Where the Category D weld around the insert plate is within a distance from the center of the opening equal to the diameter of the opening, the weld shall be 100% radiographed in that area. All butt welds in the insert plate shall be 100% radiographed.

(c) Other Category D welds and Category E, F, G, J, and full penetration category H welds shall be examined by the magnetic particle or ultrasonic examination method for the full length of the weld.

(d) All Category H partial penetration of fillet welds that have a groove depth or throat dimensions greater than 1 in. (25 mm) and T-welded joints welded with throat dimensions of $\frac{1}{2}$ in. (13 mm) or greater shall be examined by the liquid penetrant or magnetic particle method, except that the exposed ends of welds need only be visually examined.

(e) All welds, except attachment welds which do not penetrate the liner, shall be leak tested in accordance with CC-5536 for the full length of the weld.

for the full length of the weld.

(f) For all austenitic welds, liquid penetrant shall be substituted for magnetic particle examination.

(g) Permanent structural, non-structural, and temporary attachment welds shall be examined by the magnetic particle or liquid penetrant method for the full length of the weld.

CC-5522 Weld Joints in Backups

Weld joints in backup bars, and structural shapes used as backups, shall be examined by the magnetic particle, liquid penetrant, or ultrasonic examination method.

CC-5523 Splice Sleeve Welds

The surfaces of all welds between splice sleeves and the liner shall be visually examined.

CC-5524 Stud Welds

Stud welds shall be visually examined.

CC-5525 Leak-Chase Systems

All the welds in the leak-chase systems shall be leak tested.

Page 143

CC-5526 Electroslag Welds

In addition to the requirements for the type of weld being examined, all complete penetration welds made by the electroslag welding process in ferritic materials shall be ultrasonically examined.

CC-5530 EXAMINATION PROCEDURES

CC-5531 Radiographic Examination

CC-5531.1 Examination Procedure.

Radiographic examination as required by CC-5520 shall be performed in accordance with Article 2 of Section V, except that the geometric unsharpness shall not exceed the limits of T-251.

CC-5531.2 Extent of Examination.

The first 10 ft (3.0 m) of weld and one spot (not less than 10 in. (254 mm) in length) in each additional 50 ft (15.2 m) increment of weld (weld test unit), or fraction thereof, shall be radiographed for each welder and welding position (flat, vertical, horizontal, and overhead). In any case, a minimum of 2%, by length, of all butt welds shall be radiographed, except that when backup bars are used for a liner height exceeding 10 ft (3.0 m), the extent of radiography shall be increased to 4%. The 100% radiography required by CC-5521(b) shall not be included in determining the 2% or 4%.

CC-5531.3 Selection of Spots for Radiographic Examination.

The spots of welds to be radiographically examined shall be randomly selected but no two spots in adjacent weld test units shall be closer than 10 ft. The location of all spots shall be recorded.

CC-5531.4 Time of Examination.

Radiographic examination shall be performed prior to the placement of concrete or other obstructions.

CC-5531.5 Repair and Reexamination

(a) The examination of the first 10 ft (3.0 m) of weld required by CC-5531.2 is acceptable when the aggregate length of

unacceptable discontinuities is less than 10 in. If this requirement is not met, the welder's next 10 ft of weld shall be radiographed and evaluated to the acceptance criteria above. All defective welding disclosed shall be repaired and reradiographed.

(b) When a radiographed spot meets the acceptance standards of CC-5542, the entire weld unit represented by the spot is considered acceptable. When a radiographed spot fails to meet the specified acceptance standards, two additional spots shall be radiographically examined in the same weld test unit at locations at least 1 ft (305 mm) removed on each side from the original spot. The locations of these additional spots shall be determined using the same procedure followed in the selection of the original spot for examination, and the examination results shall determine the corrective actions of (1) and (2) below.

(1) If the two additional spots examined meet the acceptance standards, the entire weld unit represented by the three spot radiographs is considered acceptable. However, the defective welding disclosed by the first of the three radiographs shall be repaired and reradiographed.

(2) If either of the two additional spots examined fails to meet the specified acceptance standards, the entire weld test unit is unacceptable. The entire unacceptable weld shall be removed and the joint shall be rewelded or, optionally, the entire weld unit may be completely radiographed and defective welding only need be repaired.

(c) Repair welding shall be performed using a qualified procedure. The weld repaired areas in each weld test unit shall be radiographed to meet the acceptance criteria specified in CC-5542.

CC-5533 Liquid Penetrant Examination

Liquid penetrant examination shall be performed in accordance with Article 6 of Section V.

CC-5534 Magnetic Particle Examination

Magnetic particle examination shall be performed in accordance with Article 7 of Section Vi.

CC-5535 Ultrasonic Examination

Ultrasonic examination shall be performed in accordance with Article 5 of Section V.

CC-5536 Leak Testing

CC-5536.1 Liner Welds.

Leak testing of liner welds shall be performed by either the vacuum box method in accordance with Appendix IX of this Division, the solution film test in accordance with Appendix I in Article 10 of Section V, the halogen diode method in accordance with Appendix III in Article 10 of Section V, or the helium mass spectrometer method in accordance with Appendix IV in Article 10 of Section V.

CC-5536.2 Leak-Chase Systems.

Leak testing of leak-chase systems shall be performed as follows.

The channels shall be pressurized to at least 115% of the design pressure, but not less than 25 psi (172 kPa).

Page 144

The pressure shall be gradually increased to not more than one-half of the test pressure, after which the pressure shall be increased in steps of approximately one-tenth of the test pressure until the required test pressure has been reached. The final test pressure shall not be applied until the leak chase channels and pressuring medium are approximately the same temperature.

The test gage shall conform to the requirements of CC-6222. The test pressure shall be held for a minimum of 2 hr. The pressure decay shall not exceed $\frac{1}{2}$ of 1% of the test pressure.

CC-5537 Visual Examination

Visual examination shall be performed in accordance with Article 9 of Section V.

CC-5540 ACCEPTANCE STANDARDS

CC-5541 General Requirements

Unacceptable weld defects shall be removed or reduced to an acceptable size, and, when required, the weld shall be repaired and reexamined in accordance with CC-4540. Acceptance standards for welds shall be as stated in CC-5540, while acceptance standards for material adjacent to the weld shall be as stated in CC-2530.

CC-5542 Radiographic Acceptance Standards

Welds that are shown by radiography to have any of the following types of discontinuities are unacceptable:

(a) any type of crack or zone of incomplete fusion or penetration;

(b) any other elongated indication which has a length greater than:

(1) $\frac{1}{4}$ in. (6 mm) for t up to $\frac{3}{4}$ in. (19 mm), inclusive

(2) $\frac{1}{3}t$ for t from $\frac{3}{4}$ in. (19 mm) to $2\frac{1}{4}$ in. (57 mm), inclusive

(3) $\frac{3}{4}$ in. (19 mm) for t over $2\frac{1}{4}$ in. (57 mm) where t is the thickness of the thinner portion of the weld;

(c) any group of indications in line that have an aggregate length greater than t in a length of $12t$, except where the distance between the successive indications exceeds $6L$, in which case the aggregate length is unlimited, L being the length of the largest indication;

(d) porosity in excess of that shown as acceptable in Appendix VI.

CC-5544 Liquid Penetrant Acceptance Standards

CC-5544.1 Evaluation of Indications

(a) Mechanical discontinuities at the surface will be indicated by bleeding out of the penetrant; however, localized surface imperfections such as may occur from machining marks or surface conditions may produce similar indications which are nonrelevant to the detection of unacceptable discontinuities.

(b) Any indication which is believed to be nonrelevant shall be regarded as a defect and shall be reexamined to verify whether or not actual defects are present. Surface conditioning may precede the reexamination. Nonrelevant indications and broad areas of pigmentation which would mask indications of defects are unacceptable.

(c) Relevant indications are indications which result from mechanical discontinuities. Linear indications are indications in which the length is more than three times the width. Rounded indications are indications which are circular or elliptical with the length less than three times the width.

CC-5544.2 Acceptance Standards

(a) Only indications with major dimensions greater than $\frac{1}{16}$ in. (1.6 mm) shall be considered relevant.

(b) Unless otherwise specified in this Subsection, the following relevant indications are unacceptable:

(1) any cracks or linear indications;

(2) rounded indications with dimensions greater than $\frac{3}{16}$ in. (4.8 mm);

(3) four or more rounded indications in a line separated by $\frac{1}{16}$ in. (1.6 mm) or less edge to edge;

(4) ten or more rounded indications in any 6 sq in. (3871 mm²) of surface with the major dimension of this area not to exceed 6 in. (152 mm), with the area taken in the most unfavorable location relative to the indications being evaluated.

CC-5545

CC-5545 Magnetic Particle Acceptance Standards

CC-5545.1 Evaluation of Indications

(a) Mechanical discontinuities at the surface will be indicated by the retention of the examination medium. All indications are not necessarily defects, however, since certain metallurgical discontinuities and magnetic permeability variations may produce similar indications which are not relevant to the detection of unacceptable discontinuities.

(b) Any indication which is believed to be nonrelevant should be regarded as a defect and shall be reexamined by the same or other nondestructive examination

Page 145

methods to verify whether or not actual defects are present. Surface conditioning may precede the reexamination. After an indication has been verified to be nonrelevant, it is not necessary to reinvestigate repetitive, nonrelevant indications of the same type. Nonrelevant indications which would mask indications of defects are unacceptable.

(c) Relevant indications are indications which result from unacceptable mechanical discontinuities. Linear indications are indications in which the length is more than three times the width. Rounded indications are indications which are circular or elliptical with the length less than three times the width.

CC-5545.2 Acceptance Standards

(a) Only indications with major dimensions greater than $\frac{1}{16}$ in. shall be considered relevant.

(b) Unless otherwise specified in this Subsection, the following relevant indications are unacceptable:

(1) any cracks or linear indications;

(2) rounded indications with dimensions greater than $\frac{3}{16}$ in. (4.8 mm);

(3) four or more rounded indications in a line separated by $\frac{1}{16}$ in. (1.6 mm) or less edge to edge;

(4) ten or more rounded indications in any 6 sq in. (3871 mm²) of surface with the major dimension of this area not to exceed 6 in. (152 mm) with the area taken in the most unfavorable location relative to the indications being evaluated.

CC-5546 Ultrasonic Acceptance Standards

All indications which produce a response greater than 20% of the reference level shall be investigated to the extent that the operator can determine the shape, identity, and location of all such reflectors and evaluate them in terms of the acceptance rejection standards as given in (a) and (b) below.

(a) Indications are unacceptable if the amplitude exceeds the reference level and discontinuities have lengths which exceed:

(1) $\frac{1}{4}$ in. (6 mm) for t up to $\frac{3}{4}$ in. (19 mm), inclusive

(2) $\frac{1}{3}t$ for t from $\frac{3}{4}$ in. (19 mm) to $2\frac{1}{4}$ in. (57 mm), inclusive

(3) $\frac{3}{4}$ in. (19 mm) for t over $2\frac{1}{4}$ in. (57 mm). where t is the thickness of the weld being examined. If a weld joins two members having different thicknesses at the weld, t is the thinner of these two thicknesses.

(b) Where indications are interpreted to be cracks, lack of fusion, or incomplete penetration, they are unacceptable regardless of discontinuity or signal amplitude.

CC-5547 Leak Testing Acceptance Standards

CC-5547.1 Evaluation of Indications

CC-5547.1.1 Vacuum Box and Leak-Chase System Testing.

Through-thickness discontinuities will be indicated by the formation of a continuous stream of bubbles in the soap solution. The formation of small single bubbles shall not be considered relevant.

CC-5547.1.2 Halogen Diode or Helium Mass Spectrometer Test.

Through-thickness discontinuities will be indicated when the leakage rate exceeds that obtained from the applicable capillary leak calibration.

CC-5547.2 Acceptance Standards.

All through-thickness indications are unacceptable and shall be repaired and retested.

CC-5548 Visual Acceptance Standards

(a) All areas around each stud weld which indicate lack of fusion or absence of weld are unacceptable and shall be repaired.

(b) For welds between splice sleeves and the liner or structural element, and welds in embedment anchors (CC-5600), the following imperfections are unacceptable:

(1) any crack;

(2) surface porosity, the sum of whose diameters exceeds $\frac{3}{8}$ in. (10 mm) in any linear inch of weld or $\frac{3}{4}$ in. (19 mm) in any 12 in. (305 mm) length of weld. As-welded surfaces are permitted; however, the surface of welds shall be free from coarse ripples and grooves and abrupt ridges and valleys. Unacceptable imperfections shall be removed or reduced in order to meet the above limits and reexamined.

SEC III D2 CC-6000

ARTICLE CC-6000 STRUCTURAL INTEGRITY TEST OF CONCRETE CONTAINMENTS

Page 147

CC-6100 GENERAL REQUIREMENTS

CC-6110 INTRODUCTION

This Article contains the requirements for structural integrity testing of concrete containments (CC). The CC shall be tested for structural acceptability as a prerequisite for Code acceptance and stamping. The test is performed at a test pressure of at least 1.15 times the containment design pressure to demonstrate the quality of construction and to verify the acceptable performance of new design features. The structural integrity test (SIT) shall include the differential pressure test of the boundary between the drywell and wetwell compartments of pressure suppression type containments if the boundary loading induces stresses in the containment structure. The differential pressure shall be at least 1.0 times the maximum design differential pressure. However, measurements made solely to demonstrate integrity of the compartment boundary, as distinct from the containment, are not subject to the requirements of this Article. The requirements for the structural test are contained in CC-6300. The test and instrumentation plan shall be defined by the Designer and implemented by the Constructor. The Designer or his designated representative shall witness the integrity test. Test results and conclusions shall be documented in the construction report. The duties of the Authorized Inspector with respect to this test are stipulated in NCA-5280 and NCA-5290.

CC-6120 TEST AND INSTRUMENT PLAN

CC-6121 Scope

The test and instrumentation requirements shall be defined in the Design Specification and included in the Construction Specification. The Construction Specification shall describe the type and location of instrumentation and shall also include

Specification. The Construction Specification shall describe the type and location of instrumentation and shall also include a description of the method of applying the test pressure. This test plan shall be available prior to construction so that sufficient time will be available for the placement of any instrumentation to be embedded in concrete or otherwise installed during construction.

CC-6122 Alteration of Test Plan

The Designer may alter the test plan required by CC-6121 at any time prior to completion of the test.

CC-6123 Weather

The limits of design environmental conditions under which the test may be conducted shall be specified by the Designer. The test shall be postponed or interrupted if environmental conditions are not within the limits specified by the Designer or are such as to pose a safety hazard to test personnel.

CC-6130 TESTING OF DIVISION 1 PARTS, APPURTENANCES, AND COMPONENTS

If parts, appurtenances, and components designed under the rules of Division 1 are to be tested during the containment structural integrity test, they shall be examined in accordance with the rules of Division 1. Any examination required by Division 1 to be performed at elevated pressure shall be done at the structural integrity test pressure ($1.15 \times$ design pressure).

CC-6140 PRETEST CONDITIONS

The CC shall be structurally complete and equipped with the permanent access hatch covers and airlock doors. Piping and electrical penetrations shall either be

Page 150

complete or the penetration sleeves fitted with temporary closures which transfer the pressure load to the sleeve in a similar manner as the permanent penetration device.

CC-6150 CLASSIFICATION OF STRUCTURE

CC-6151 Prototype Containments

A CC incorporating new or unusual design features not yet confirmed by tests, as determined by the Designer, shall be designated a prototype containment.

CC-6152 Nonprototype Containments

A CC shall be designated a nonprototype containment when the Designer has determined that the design has been verified by previous tests on prototype containments.

CC-6160 STRUCTURAL RESPONSE PREDICTIONS

Predictions of displacements, and, in prototype containments, strains, shall be made prior to the start of the test.

CC-6200 TEST PROCEDURE

CC-6210 PRETEST EXAMINATION

Prior to pressure testing, a thorough visual examination of the accessible portions of the containment shall be made by the Designer or his designee. The object of such examination is to record conditions such as spalling or unusual cracking of the concrete, bulging, deformation, or other damage to the liner, and other data which may be needed to interpret the behavior of the containment.

CC-6220 INSTRUMENTATION

CC-6221 Purpose

Instrumentation shall be incorporated into the CC for measurement of displacements. Prototype containments shall also include provisions for strain measurements.

CC-6222 Pressure

Pressure gages used in pressure testing shall be connected directly to the internal environment of the containment, and measure the differential pressure between the internal and external environments.

CC-6222.1 Range of Pressure Gages.

Pressure gages used in testing shall have a range of not more than four times the test pressure.

CC-6222.2 Calibration of Pressure Gages.

Gages shall be calibrated against a deadweight tester or a calibrated master gage prior to and after each test.

CC-6222.3 Accuracy.

Gages shall be accurate to within $\pm 2\%$ of test pressure.

CC-6223 Displacements

Displacement measuring instrumentation shall be attached directly to the containment shell. If the attachment is made to the liner, the Designer shall identify locations. Consideration shall be given to possible separation between the liner and the concrete. Devices may be connected either to two points on the containment or to one point on the containment and a point on a reference structure inside or outside of the containment.

CC-6223.1 Accuracy of Measurements.

Specifications for displacement transducers shall provide for an accuracy of $\pm 5\%$ of the anticipated displacement at the point of maximum displacement as predicted or within 0.01 in. (0.25 mm), whichever is greater.

CC-6224 Strain

Strain measuring devices shall be appropriate for the material for which strain is to be measured.

CC-6224.1 Accuracy of Strain Measuring Devices.

Devices used for strain measurements shall be specified to have an accuracy of $\pm 5\%$ of the maximum anticipated strain on the structure or $10 \mu\text{in./in.}$, whichever is greater. The minimum gage length shall be 4 in. (102 mm) for measurement of internal concrete strains or measurement of strains on concrete surfaces.

CC-6225 Crack Measurements

The widths of cracks shall be measured in the specified areas with optical comparators or wire gages. Lengths of cracks shall be measured with linear scales, or estimated if a grid is marked on the crack mapping area. Measuring devices used to measure cracks shall be capable of measuring a minimum width of 0.005 in. (0.13 mm) and have a resolution of 0.003 in. (0.076 mm).

Page 151

CC-6226 Temperature

Concrete temperatures measured in conjunction with strains shall be measured with thermocouples or resistance elements. Standard thermometry devices may be used to measure ambient air temperature inside and outside the CC. Temperature measuring devices shall have an accuracy of $\pm 2^\circ\text{F}$ ($\pm 1.1^\circ\text{C}$) and a range sufficient to cover the range of temperatures expected at the device location during the test. Devices which are embedded in concrete shall be designed for long-term operation in the concrete environment.

CC-6230 PRETEST OF INSTRUMENTATION

Prior to the start of the test, the output of all instruments shall be recorded. Instruments which display undue drift or erratic readings shall be corrected, if possible, or noted. All malfunctioning instrumentation shall be reported to and evaluated by the Designer.

CC-6231 Instrument Malfunction During Test

Instruments which become erratic or inoperative during the test shall be reported to the Designer. If the Designer determines that data at this location is essential, alternate instrumentation shall be installed before proceeding with the test.

CC-6300 STRUCTURAL TEST REQUIREMENTS

CC-6310 INTRODUCTION

This subarticle contains the requirements for containment pressurization, measurements of structural response, and data collection during the SIT. These requirements apply to the containment configurations defined below. If containment configuration is such that these requirements cannot be implemented, the Designer shall specify alternative requirements. The following four containment configurations are addressed in this subarticle.

(a) Cylinder dome containments consist of a free-standing concrete cylinder, supported on a reinforced concrete base mat and closed by a concrete dome. The cylindrical wall and dome may be conventionally reinforced or prestressed. Cylinder dome containments may be of the pressurized water reactor (PWR) type or the boiler water reactor (BWR) type with a drywell structure supported by the base mat and enclosed by the containment.

(b) Cylinder cone containments consist of a concrete cylinder supported by a reinforced concrete base mat and topped by a concrete cone. The top of the cone is closed by a steel dome head. The cone and cylinder are the drywell and wetwell compartments of a BWR containment, respectively, and are separated by a diaphragm slab which may or may not transmit forces to the cylinder-cone juncture. The concrete cylinder and cone may be conventionally reinforced or prestressed.

(c) Hybrid containments consist of mixed construction of reinforced concrete and steel. The transition of steel to concrete may be at the cylinder-to-mat junction, the cylinder-to-dome junction, or at any location in between.

(d) Other containments are those with vertical and horizontal (including curved or dome type) pressure boundaries with configurations not defined above.

CC-6320 PRESSURIZATION

Containments shall be subjected to an integrity test during which the internal pressure is increased from atmospheric pressure to the test pressure and held for at least 1 hr. If the differential pressure test of the boundary between the drywell and wetwell compartments of pressure suppression type containments induces stresses in the containment shell, the differential pressure test sequence shall be included in the pressurization plan. The test requirements herein are based on the use of atmospheric air as the testing medium.

CC-6321 Rate

The CC shall be pressurized and depressurized at rates not to exceed 20% of test pressure per hour.

CC-6330 TEMPERATURE

The internal temperature shall be controlled as required for any Division 1 components, parts, or appurtenances which are pressurized during this test. Representative temperatures shall be measured if required for displacement and strain measurement corrections.

CC-6340 DATA REQUIRED

Strains, displacements, temperatures, and pressures shall be recorded at atmospheric pressure prior to starting pressurization, at reaching the test pressure, 1 hr after reaching test pressure, and upon completion of depressurization. In addition, at least five sets of

readings shall be taken during pressurization and depressurization to monitor the containment response.

CC-6350 SURFACE CRACKING

The patterns of cracks that exceed 0.01 in. (0.25 mm) in width and 6 in. (152 mm) in length shall be mapped at specified locations before the test, at maximum pressure, and after the test. Locations shall be specified by the Designer and shall include areas where high surface tensile strain is predicted. At each location, an area of at least 40 sq ft (3.7 m²) shall be mapped.

CC-6360 DISPLACEMENT MEASUREMENTS

The Designer shall evaluate the recorded test data during the test as necessary to permit a determination that the test may proceed safely.

CC-6361 Cylinder Dome Containments

Displacement measurements of the CC as defined in CC-6310 shall meet the following provisions.

(a) Radial displacements of the cylinder at a minimum of five approximately equally spaced elevations located at 20%, 40%, 60%, 80%, and 100% of the distance between the base and the spring line. However, if the CC has a thickened lower wall section (thickness increase greater than 25% extending more than three nominal wall thicknesses in height above the base slab), one of the five displacement measurement elevations shall be at the discontinuity between the thickened wall and the nominal wall. The remaining elevations specified for radial displacements shall be readjusted to provide approximately equal spacing between the base slab and the discontinuity and between the discontinuity and the spring line. These measurements shall be made at a minimum of four approximately equally spaced azimuths. Measurement of the total displacement may be made between diametrically opposite locations on the containment wall. The radial displacement may be assumed to be equal to one-half of the measured change in diameter.

(b) Radial displacements of the containment wall adjacent to the largest opening, at a minimum of 12 points, four equally spaced on each of three concentric circles. The diameter of the inner circle shall be just large enough to permit measurements to be made on the concrete rather than on the steel sleeve; the middle approximately 1.75 times the diameter of the opening; and the outer approximately 2.5 times the diameter of the opening. For hatch designs with thickened wall sections, the concentric circle at 1.75 times the diameter shall be relocated at the wall thickness discontinuity and the remaining circle shall be relocated approximately two wall thicknesses outside the discontinuity. The increase in diameter of the opening shall be measured in the horizontal and vertical directions. If other openings require structural verification as determined by the Designer, displacement measurements shall be made in the same manner as stipulated for the largest opening.

(c) Vertical displacement of the top of the cylinder relative to the base, at a minimum of four approximately equally spaced azimuths.

(d) Vertical displacements of the dome of the containment at a point near the apex and two other approximately equally spaced intermediate points between the apex and the spring line on at least one azimuth.

CC-6362 Cylinder Cone Containments

Displacement measurements of CC as defined in CC-6310 shall meet the following provisions.

(a) Radial displacement measurements at midheight of the cylinder, midheight of the cone, the top of the cone, and the cone-cylinder junction if the drywell floor is not constructed integral with the containment wall, shall be made at a minimum of four approximately equally spaced azimuths. Measurements should be perpendicular to the containment centerline or corrections made so these measurements refer to the containment centerline.

(b) Radial displacements of the containment wall adjacent to the largest opening, at a minimum of 12 points, four equally spaced on each of three concentric circles. The diameter for the inner circle shall be large enough to permit measurements to be made on the concrete rather than on the steel sleeve; the middle approximately 1.75 times the diameter of the

opening; and the outer approximately 2.5 times the diameter of the opening. The change in diameter of the opening shall be measured on the horizontal and vertical axes. If other openings require structural verification as determined by the Designer, displacement measurements shall be made in the same manner as stipulated for the largest opening.

(c) Vertical displacement of the top of the cone relative to the base mat-wall junction shall be measured at a minimum of four approximately equally spaced azimuths.

Page 153

CC-6363 Hybrid Containmentment

Displacement measurements of the CC as defined in CC-6310 shall meet the following provisions.

(a) Radial displacements of the concrete construction portion of the cylinder at a minimum of three elevations approximately equally spaced between the base slab and the steel-concrete juncture for containments in which the steel-concrete juncture is located in the upper one-third of the cylinder wall. For steel-concrete juncture locations in the mid one-third of the cylinder wall, radial displacements shall be measured in the concrete portion at two elevations approximately equally spaced. For steel-concrete juncture locations in the lower one-third of the cylinder wall, radial displacements shall be measured in the concrete portion at one elevation approximately equidistant between the base slab and the steel-concrete juncture. In addition, radial displacements shall be measured at the steel-concrete juncture for all juncture locations. These measurements shall be made at a minimum of four approximately equally spaced azimuths. For containments in which the steel-concrete juncture is at the cylinder-base mat intersection, no radial or vertical displacement measurements are required.

(b) Radial displacements of the containment wall adjacent to the largest opening if located in the concrete construction portion. The displacement measurements shall meet the provisions of CC-6361.

(c) Vertical displacement of the concrete portion of the cylinder at a minimum of four approximately equally spaced azimuths measured from the base slab to the wall steel-concrete juncture.

The steel shell shall be examined for leakage in compliance with NE-6224 except as noted in CC-6130.

CC-6365 Other Containmentments

Displacement measurement of containments as defined in CC-6310 which have vertical pressure boundaries and horizontal closures shall meet the following general provisions.

(a) Horizontal (radial) displacement of the primary vertical pressure retaining walls at a minimum of three elevations approximately equally spaced between major load carrying restraints (base slab, diaphragm slabs, spring lines, etc.) or major discontinuities (wall thickness transitions, steel-concrete junctures, etc.), and at the elevations of major discontinuities. These measurements shall be made at a minimum of four approximately equally spaced azimuths.

(b) Vertical displacement of the primary pressure retaining walls at a minimum of four locations nominally spaced to verify gross extension as determined by the Designer.

(c) Vertical displacement of horizontal primary pressure boundaries (domes, slabs, etc.) at a minimum of the structural centerline or as near as practical to the centerline (dome apex) and two other approximately equally spaced locations between the structural centerline and the vertical primary pressure retaining walls on a common azimuth.

(d) Radial displacements of the pressure boundary adjacent to the largest opening. The displacement measurements shall follow the provisions of CC-6361 to the extent possible.

CC-6370 STRAIN MEASUREMENTS

Prototype containments shall be instrumented to measure strain. The strain measuring instrumentation shall be located so as to demonstrate the structural behavior of the prototypical features and the influence of these features on adjacent areas of the containment. The Designer shall, in selecting locations for strain measurement, give particular attention to the influence of the prototypical features on the following areas of the containment:

(a) the intersection of the wall and base slab;

- (b) the vicinity of the largest opening in the concrete construction portion;
- (c) other areas of major discontinuity in the curvature, slope, or thickness of the shell;
- (d) horizontally or vertically restrained areas;
- (e) steel-to-concrete transition areas.

These areas shall be instrumented to measure strain if structurally influenced by the prototypical feature.

CC-6371 Baseline Measurements

Strains and associated temperatures shall be measured for a minimum period of 24 hr prior to the test to evaluate the strain variations resulting from temperature changes.

CC-6380 TEMPERATURE MEASUREMENTS

When strain measurements are to be made, temperatures shall be measured at containment shell locations as specified in the Design Specifications to establish representative temperatures for strain measurements. Temperature measurements shall be used to correct measured strain values for thermal effects.

Page 154

CC-6390 POST-TEST EXAMINATION

A post-test examination shall be made within 1 week of depressurizing. The same examination made during the pretest required by CC-6210 shall be performed.

CC-6400 EVALUATION OF TEST RESULTS

CC-6410 ACCEPTANCE CRITERIA

The CC shall be considered to have satisfied the structural integrity test if the following minimum requirements are met.

- (a) Yielding of conventional reinforcement does not develop as determined from analysis of crack width, strain, or displacement data.
- (b) No visible signs of permanent damage to either the concrete structure or the steel liner are detected. Evidence, resulting from the test, of spalling, laminations, or voids behind the liner are pertinent considerations. Special care shall be exercised in the post-test examination (CC-6390) to detect evidence of localized distress which may not be revealed by strain or displacement data. The significance of such distress, if detected, must be determined by the Designer and be acceptable to the Owner.
- (c) Residual displacements at the points of maximum predicted radial and vertical displacement at the completion of depressurization or up to 24 hr later shall not exceed the following.
 - (1) For conventionally reinforced containments or conventionally reinforced directions of partially prestressed containments: 30% of measured or predicted displacement at maximum test pressure, whichever is greater, plus 0.01 in. (0.25 mm) plus measurement tolerance.
 - (2) For prestressed containments or prestressed directions of partially prestressed containments: 20% of measured or predicted displacement at maximum test pressure, whichever is greater, plus 0.01 in. (0.25 mm) plus measurement tolerance.

The above criteria shall be applied to the average of radial displacements measured at the same elevation.

- (d) The measured displacements at test pressure at points of predicted maximum radial and vertical displacements do not exceed predicted values by more than 30% plus measurement tolerance. This criterion shall apply to the average of radial displacement measured at the same elevation. This requirement may be waived if the residual displacements within 24 hr are not greater than 10% for prestressed structures or 20% for conventionally reinforced concrete structures.

CC-6420 SURFACE CRACKS

Cracks data shall be reviewed by the Designer for evaluation of overall test results.

CC-6430 RETEST

If the measurements indicate that the requirements of CC-6410 are not met, further study by the Designer will be required. Consideration should be given to the possible effects of creep and temperature change, as well as possible inaccuracies in the measured quantities or the predicted values. If such studies still indicate that requirements of CC-6410 are not fulfilled, remedial measures shall be undertaken or a retest shall be conducted. If the containment experiences major structural changes or significant damage requiring repairs after the test, the integrity test shall be repeated following the completion of the corrective actions. In the areas where major structural repairs are performed, additional instrumentation shall be provided to determine whether the structural repair is providing suitable structural capability. Special attention shall be given to shrinkage and creep effects caused by variations in age and composition of the repaired area.

CC-6440 STRAINS

Strain measurements shall be reviewed by the Designer for evaluation of the overall test results.

CC-6500 ANALYSIS OF DATA AND PREPARATION OF REPORT

CC-6510 RESOLUTION OF TEST DATA

The results of the test shall be furnished to and examined by the Designer. Discrepancies between measured and predicted strain or deformation shall be resolved satisfactorily by review of the design, evaluation of measurement tolerances, material variability, and reexamination of the containment.

CC-6520 PRESENTATION OF DATA

Data shall be presented in the final report so that direct comparisons between predicted values and measured values may be made.

Page 155

CC-6530 MINIMUM REPORT REQUIREMENTS

The following minimum information shall be included in the final test report.

- (a) a description of the test procedure and the instrumentation;
- (b) a comparison of the measured displacements and strains with the predicted response including tolerance;
- (c) a summary and discussion of crack measurements;
- (d) an evaluation of the estimated accuracy of the measurements;
- (e) an evaluation of any deviation (such as test results that exceed the allowable limits), the disposition of the deviations, and the need for corrective measures.

APPENDIX II CONCRETE MULTIAXIAL COMPRESSIVE STRENGTH MODIFICATION

Page 173

ARTICLE II-1000 COMPRESSIVE STRENGTH MODIFICATION

II-1100 C FACTOR

(a) The C factor used in Table CB-3421-1 shall be determined numerically as follows.

(1) In a triaxial compression field, where the smallest of the three compressive stresses has a numerical value greater than $0.15f_{cua}$ and the largest is less than $3f_{cua}$, the procedure outlined below provides safe and conservative values for C .

(2) For cases of triaxial compression where the numerical value of the smallest compressive stress is less than $0.15f_{cua}$ (for cases of essentially biaxial compression), and for triaxial states of stress where biaxial compression is combined with tension in the third direction, the Designer shall justify values of $C \geq 1$ by including in the Design Document appropriate evidence substantiating his values.

(b) *Procedure for Determining C*

(1) Let f_{c1} , f_{c2} , and f_{c3} be the three principal compressive stresses at a point in the concrete (where compressive stresses are taken as positive, and f_{c1} is the largest, f_{c2} the intermediate, and f_{c3} the smallest compressive stress) within the limits of $f_{c1} < 3f_{cua}$ and $f_{c3} > 0.15f_{cua}$. The following procedure may be used to calculate C .

(a) Calculate the ratios f_{c2}/f_{cua} and f_{c3}/f_{cua} .

(b) Enter the ordinate of Fig. II-1 at the value f_{c2}/f_{cua} .

(c) The horizontal line given by f_{c2}/f_{cua} intercepts the curve f_{c3}/f_{cua} . When this horizontal line does not intercept the specified curve stress, augmentation arising from multiaxial loading cannot be assumed, and a value of $C = 1$ must be used.

(d) The higher of the abscissa values of these two intercept points is the C factor, which may be applied to f_{cua} when the compressive concrete stress limits are evaluated.

APPENDIX III GLOSSARY OF TERMS AND NOMENCLATURE

Page 175

ARTICLE III-1000 TERMS

For the terms related to cement and concrete not defined herein, refer to ACI 116R, Cement and Concrete Terminology. Terms listed in this Article have a specific meaning applicable to the Code.

anchor, concrete - a member, usually a steel rod with a bend at one end or a headed bolt embedded in the concrete, to which a liner, embedment, or surface-mounted item is attached to prevent that item from pulling away from the hardened concrete

auxiliary systems - features exclusively intended to control or monitor conditions affecting structural integrity that augment the concrete reactor vessel or containment (for example, vessel cooling and insulation, corrosion protection systems, and stress-strain instrumentation)

bending stress - bending stress is the variable component of normal stress; the variation may or may not be linear across the thickness

bulk concrete temperature - the temperature of concrete sufficiently remote from thermal or geometric discontinuities as to be representative of the generalized temperature profile controlling overall structural response. Maximum values are established on the basis of acceptable material behavior for the load category under consideration.

channel - a circumferential recess or groove formed in the external surface of a CRV or containment for the purpose of retaining a circumferential prestressing system

coating-tendon - material used to protect against corrosion or to lubricate the prestressing system

component - a concrete reactor vessel or containment which is governed by the rules of this Division (NCA-1210)

concrete placement - the deposition of concrete or the ingredients for concrete into forms or into members of a structure which serve as forms

coupling - the means by which the prestressing force is permanently transmitted from one portion of the prestressing steel to another to form a complete tendon

ductility - the ratio of the maximum deformation or deflection of the member at the point of collapse to the maximum elastic deformation or deflection at specified minimum yield in the member

effective temperature at liner-concrete interface - the temperature obtained by geometrically projecting the temperature gradient in the bulk of the concrete to the liner-concrete interface

embedment - an item such as an anchor bolt, screed, or conduit encased or partially encased in concrete. Reinforcing systems, liners, and structural members are not considered embedments.

Fabricator - an organization that builds one or more parts (NCA-1231) for the components within the scope of this Division (NCA-3610)

guaranteed ultimate tendon strength (GUTS) - GUTS is the lower of:

(1) the maximum tensioning force that can be applied without breaking more than 2% of the tendon tension members and that can be guaranteed for all tendons

(2) the minimum guaranteed wire, strand, or bar strength times the number of tendon wires, strands, or bars based on test conditions of 70°F (21°C), static loads, and unirradiated samples

leak-chase channel - a channel section permanently installed over a liner weld to permit leak testing of the weld

leak-tight integrity - the ability of a component to maintain a prescribed maximum leakage rate under all service conditions

Page 176

liner - a permanent metal membrane attached to the surface of a concrete reactor vessel, containment, or penetration in order to form a leak-tight enclosure

local hot spots - the maximum local temperature at the liner in any part of the primary coolant due to either discontinuity in the thermal barrier and liner cooling system, or to attachments on the coolant side of the liner which penetrate the thermal barrier or at other locations within the bulk concrete due to radiation heating or other causes. It also includes liner areas subjected to high temperature jet impingement.

membrane stress¹ - the component of normal stress, hoop or meridional, that is uniformly distributed and equal to the average of stress across the thickness of the section under consideration

mineral admixture (fly ash and pozzolans) - a siliceous or siliceous and aluminous material, which in itself possesses little or no cementitious value but will, in finely divided form and in the presence of moisture, chemically react with calcium hydroxide at ordinary temperatures to form compounds possessing cementitious properties

operating basis earthquake - The operating basis earthquake for a site is that which produces the vibratory ground motion for which those features of the power plant necessary for continued operation without undue risk to the health and safety of the public are designed to remain functional. The maximum vibratory ground acceleration of the operating basis earthquake is equal to at least one-half that of the safe shutdown earthquake.

operating basis wind - wind velocities and forces required for the design of a structure in accordance with the uniform building code

peak stress - total stress due to local discontinuities or local thermal stress including the effects of stress concentrations. Its basic characteristic is that it does not cause any noticeable distortion and is objectionable only as a possible source of a fatigue crack or brittle fracture or a localized concrete crack. A stress which is not highly localized falls into this category if it is of a type that cannot cause noticeable distortion. Examples are stresses at a local discontinuity and thermal stresses produced by a local hot spot.

¹ As applied in this Division, membrane stress is not to be substituted for principal stress or stress intensity.

point stress - the maximum apparent stress calculated by adding the membrane stress and the maximum bending stress calculated by elemental beam formulas. When advanced analytical methods (for example, finite element analysis) are used for CRV design, the point stress is defined as the maximum stress across the section under consideration.

primary stress - any normal stress or a shear stress developed by an imposed loading which is necessary to satisfy the laws of equilibrium of external and internal forces and moments. The basic characteristic of a primary stress is that it is not self-limiting. Primary stresses which considerably exceed the yield strength in a steel member or gross cracking in concrete will result in failure or in gross distortion. A thermal stress is not classified as a primary stress. Examples are stresses due to internal pressure or to distributed live loads and bending stress in the central portion of a flat slab due to pressure.

safe shutdown earthquake - A safe shutdown earthquake for a site is that which produces the vibratory ground motion for which those features of the power plant necessary to shut down the reactor and maintain the plant in a safe condition without undue risk to the health and safety of the public are designed to remain functional.

secondary stress - a normal stress or shear stress developed by the constraint of adjacent material or by self-constraint of the structure. Its basic characteristic is that it is self-limiting. Local yielding, minor distortions, and concrete cracking can satisfy the conditions that cause the stress to occur, and failure is not to be expected. Examples are general thermal stresses, bending stress at a gross structural discontinuity, and stresses induced by concrete shrinkage and creep.

shear connectors - general term for steel members attached to the liner and embedded in the concrete to provide general compatibility of strains between liner and concrete

structural integrity - the ability of a structure or component to withstand prescribed loads

tendon - the complete assembly consisting of pre-stressing steel and anchorages, and couplings. The tendons impart prestressing forces to the concrete.

ARTICLE III-2000 NOMENCLATURE

A_1

= bearing area of the tendon anchor plate in contact with the concrete, sq in.

A_2	= maximum area of the portion of the anchorage surface that is geometrically similar to and concentric with the area of the tendon anchor plate, sq in.
A_g	= gross area of section, sq in.
A_s	= area of tension reinforcement, sq in.
A_b	= area of individual reinforcement bar, sq in.
A_v	= area of shear reinforcement within a distance t_1 , sq in.
A_{vh}	= area of shear reinforcement parallel to the main tension reinforcement, sq in.
a	= shear span, distance between concentrated load and face of support, in.
b_v	= width of cross section being investigated for shear, in.
D	= dead loads, or their related internal moments and forces, lb
D_c	= construction equipment loads, lb
D_e	= plant fixed equipment load, lb
D_h	= hydrostatic loads
D_i	= weight of internals, lb
	= snow and ice load, lb
D_r	= restraint load, lb
D_s	= soil or embankment load, lb
D_w	= structure and vessel weight, lb
d	= distance from the extreme compression fiber to the centroid of the tension reinforcement, in.
d_b	= nominal diameter of deformed bars or wire, in.
d_s	= distance from the centroidal axis of gross section, neglecting the reinforcement, to the extreme fiber in tension, in.
E_c	= modulus of elasticity, concrete, psi
E_q	= earthquake loads, lb
E_o	= operating basis earthquake, lb
E_s	= modulus of elasticity, steel, psi
E_{ss}	= safe shutdown earthquake, lb
F	= prestressing force loads, lb
F_a	= allowable liner anchor force capacity, lb
F_c	= prestressing force loads during construction staging, lb
F_e	= prestressing force loads at end of plant operational life, lb

F_j	= initial prestressing force loads upon completion of stressing, lb
F_t	= prestressing force loads at time of consideration, lb
F_u	= liner anchor ultimate force capacity, lb
F_y	= liner anchor yield force capacity, lb
f_c	= specified compressive strength of concrete, psi
f_{cc}	= apparent concrete compressive stress
f_{ci}	= compressive strength of concrete at time of initial prestress, psi
f_{cr}	= required average compressive strength of concrete used as the basis for selection of concrete proportions, psi
f_{ct}	= apparent concrete tensile stress, psi
f_{cua}	= compressive strength of concrete at time of test, psi
f_h	= tensile stress developed by a standard hook
f_{pe}	= compressive stress in concrete due to prestress only after all losses, at the extreme fiber of a section at which tensile stresses are caused by applied loads, psi
f_s	= steel stress, psi
f_{sc}	= allowable liner plate compressive stress, psi
f_{st}	= allowable liner plate tensile stress, psi
f_{pu}	= ultimate tensile strength of prestressing steel, psi
f_{py}	= specified tensile yield strength of prestressing or liner steel, psi
f_y	= specified tensile yield strength of reinforcing steel, psi
h	= total depth of section or thickness of wall, in.
I_g	= moment of inertia of gross concrete section about the centroidal axis, neglecting the reinforcing steel, in. ⁴
K	= wobble friction coefficient per ft of prestressing steel
L	= live load, or the related internal moments and forces, lb
L_m	= live load
L_c	= construction live load
l	= length of prestressing steel element from jacking end to any point z, in.
l_d	= reinforcement development length, in.
l_v	= shear span, distance between concentrated load and face of support, in.
M_u	= applied design load moment at a section, in.-lb

N_u	= design axial load normal to the cross section occurring simultaneously with V_u to be taken as positive for compression and negative for tension, and to include the effects of tension due to shrinkage and creep, lb
	= design tensile force on bracket or corbel acting simultaneously with V_u lb
P	= pressure load, lb
P_a	= accident/incident maximum pressure load, lb
P_c	= pressurized crack pressure load, lb
P_d	= differential flow pressure load, lb
P_l	= local pressure buildup load, lb
P_m	= maximum cavity pressure load, lb
P_o	= operational maximum pressure load, lb
P_v	= subatmospheric minimum pressure load, lb
P_s	= steel force at jacking end, lb
P_t	= test pressure load, lb
P_x	= steel force at any point x, lb
p	= pressure, psi
p_a	= accident/incident maximum pressure, psi
p_c	= pressurized crack pressure, psi
p_d	= differential flow pressure, psi
p_l	= local pressure buildup, psi

Page 178

p_m	= maximum cavity pressure, psi
p_o	= operational maximum pressure, psi
p_v	= subatmospheric minimum pressure, psi
p_t	= test pressure, psi
Q	= plant movable equipment loads, lb
R_o	= piping loads during operating conditions, lb
R_a	= piping loads due to increased temperature resulting from the design accident, lb
R_r	= local effects on the containment due to the design basis accident. The local effects shall include the following:
R_{rr}	= load on the containment generated by the design basis accident ² (for example, reaction of a ruptured high energy pipe during the postulated event). The time-dependent nature of the load and the ability of the structure to deform beyond yield shall be considered in establishing the structural capacity

necessary to resist the effects of R_{rr} .

R_{rj}

= load on the containment generated by the design basis accident² (for example, jet impingement from a ruptured high energy pipe during the postulated event). The time-dependent nature of the load and the ability of the structure to deform beyond yield shall be considered in establishing the structural capacity necessary to resist the effects of R_{rj} .

R_{rm}

= effects resulting from the impact of a ruptured high energy pipe on the containment during the design basis accident.² The type of impact (for example, plastic, elastic) together with the ability of the structure to deform beyond yield shall be considered in establishing the structural capacity necessary to resist the impact.

S

= standard deviation, psi

² As defined in U.S. NRC Regulatory Guide 1.70.

s

= spacing of shear reinforcement in a direction parallel to the longitudinal reinforcement, in.

T_a

= accident/incident temperature effects

T_o

= operating temperature effects

T_p

= preoperational heatup temperature effects

T_t

= test temperature effects

V_u

= total applied design shear force at section, lb

V_s

= membrane shear force, lb

W

= wind loads, lb

W_t

= tornado load, lb

W_{tm}

= tornado-generated missile impact effects. The type of impact (for example, plastic, elastic) together with the ability of the structure to deform beyond yield shall be considered in establishing the structural capacity necessary to resist the impact.

W_{tp}

= differential pressure loads due to rapid atmospheric pressure, lb

W_{tq}

= loads due to tornado wind pressure, lb

x

= distance from extreme compression fiber to neutral axis, in.

Y

= dynamic force loads, lb

Y_j

= jet impingement due to fluid discharge, lb

Y_m

= missile impingement load, lb

Y_r

= reaction load due to fluid discharge, lb

Y_w	= water force dynamic load, lb
α	= total angular change of prestressing steel profile in radians from jacking end to any point x; or angle between inclined shear reinforcement and longitudinal axis of member
δ_a	= allowable displacement for liner anchors, in.
δ_u	= ultimate displacement capacity for liner anchors, in.
ϵ_{sc}	= allowable liner plate compressive strain, in./in.
ϵ_{st}	= allowable liner plate tensile strain, in./in.
v_c	= nominal permissible shear stress carried by concrete, psi
v_u	= nominal total design shear stress, psi
ρ	= A_s/bd , sq in./sq in.
μ	= curvature friction coefficient

July 1, 1998

American Society Of Mechanical Engineers

SEC III D2 MA APP IV

APPENDIX IV APPROVAL OF NEW MATERIAL

Page 179

ARTICLE IV-1000 PROCEDURE FOR OBTAINING APPROVAL FOR NEW MATERIAL

IV-1100 CODE POLICY

IV-1110 MATERIAL WHICH WILL BE CONSIDERED

It is the policy of the Code to adopt for inclusion in this Division only such specifications that have been adopted by the American Society for Testing and Materials or those others which have been shown by the necessary testing to be suitable for CRV or containment construction.

IV-1200 DATA REQUIRED TO BE SUBMITTED WITH REQUESTS FOR APPROVAL

IV-1210 CONCRETE MATERIAL

IV-1211 Mechanical Properties

The inquirer shall furnish the specification for the concrete material, including any characteristics which deviate from the accepted ASTM standard. In addition, the inquirer shall furnish data on the properties of the proposed concrete mix using this new material inasmuch as the properties deviate from those specified herein. Special attention shall be given to the influence of the new material on concrete compressive and flexural strength, shrinkage, creep, thermal conductivity, coefficient of expansion, and modulus of elasticity. If the properties are dependent upon revised proportions, mixing, placing, or curing procedures, these shall be enumerated.

IV-1212 Additional Considerations

It is important to recognize that the continued durability of the concrete is an essential element in the service life of the structure. Data representing previous experience with the new material showing its influence on concrete durability will be useful to the Code. Also, if the new material results in the limits on chemical contaminants being exceeded, data shall

be furnished on the corrosion potential of embedded metals. Service experience or test data are the type of data to be furnished.

IV-1220 REINFORCING SYSTEM MATERIAL

IV-1221 Mechanical, Physical, and Chemical Properties

Request for acceptance of new reinforcing system material shall include specifications for the material and system characteristics. Any deviation from this Division or accepted standards shall be specifically noted.

Data shall be furnished to demonstrate that the mechanical, physical, and chemical properties of the proposed material meet the specifications. These shall include, but not be limited to, the following.

(a) Mechanical and Physical Properties

- (1) ultimate tensile strength
- (2) yield strength
- (3) elongation at rupture
- (4) specific weight
- (5) coefficient of thermal expansion
- (6) modulus of elasticity
- (7) deformation geometry

(b) Chemical Properties. Complete chemical analysis of material.

IV-1222 System Performance

Documentation shall be furnished to demonstrate that the new material will be physically and chemically compatible when assembled into a reinforced concrete system. The reinforcing system material shall meet the requirements set forth in CB-2300, CB-4300, CB-5300 or CC-2300, CC-4300, and CC-5300.

Page 180

IV-1230 PRESTRESSING SYSTEM MATERIAL

IV-1231 Mechanical, Physical, and Chemical Properties

Request for acceptance of new prestressing system material shall include specifications for the material and system characteristics. Any deviation from this Division or accepted standards shall be specifically noted.

Data shall be furnished to demonstrate that the mechanical, physical, and chemical properties of the proposed material meet the specifications. These shall include, but not be limited to, the following.

(a) Mechanical and Physical Properties

- (1) ultimate tensile strength
- (2) yield strength
- (3) elongation at rupture
- (4) reduction of area
- (5) modulus of elasticity
- (6) hardness (if applicable)
- (7) relaxation properties (if applicable)

(b) *Chemical Properties.* Complete chemical analysis of the material.

IV-1232 System Performance

Documentation shall be furnished to demonstrate that the new material will be physically and chemically compatible when assembled into a prestressed concrete system. The prestressing system material shall meet the requirements set forth in CB-2400, CB-4400, CB-5400 or CC-2400, CC-4400, and CC-5400.

IV-1240 LINER MATERIAL

IV-1241 Mechanical Properties

(a) Together with the specification for the material, the inquirer shall furnish adequate data on which to base allowable stress or strain values for inclusion in the applicable tables. The data shall include values of ultimate strength, yield strength, reduction of area, elongation, and strain fatigue of base metal and welded joints over the range of temperatures at which the material is to be used. Any heat treatment that is required to produce the tensile properties should be fully described. Adequate data on the notch toughness in the proposed service temperatures must be furnished. The brittle fracture characteristics of the material, and particularly of steels which will be subjected to neutron irradiation during service, are especially important. This information is required for both base metal and weld metal, including the weld heat affected zone, in the heat treated condition in which it will be in service. If in the intended service the material will be exposed to neutron irradiation, the effects of such exposure on the nil-ductility transition temperature should be submitted if known. Service experience in the temperature range contemplated will be useful.

(b) If the material is to be used in components to operate under external pressure or load, stress-strain curves (tension or compression) shall be furnished for the range of temperature desired.

IV-1242 Weldability

The inquirer shall furnish complete data on the weldability of material intended for welding, including data on procedure and performance qualification tests made in accordance with the requirements of Section IX. Welding tests shall be made over the range of thickness in which the material is to be used. Pertinent information such as heat treatment required, susceptibility to air hardening, and the amount of experience in welding the material shall be given.

IV-1243 Physical Changes

It is important to know the structural stability characteristics and the degree of retention of properties with exposure of temperature and neutron irradiation of new material. The influence of fabrication practices (such as forming, welding, and thermal treatments on the mechanical properties, ductility, and microstructure of the material) are important, particularly where a degradation in properties may be encountered. Where particular temperature ranges of exposure or heat treatment, cooling rates, combination of mechanical working and thermal treatments, fabrication practices, etc., cause significant changes in the mechanical properties, microstructure, resistance to brittle fracture, etc., it is of prime importance to call attention to those conditions which should be avoided in service or in the manufacture and fabrication of parts or components from the material.

IV-1300 PROPRIETARY MATERIAL

IV-1310 PATENTS AND LICENSES

The inquirer shall state whether or not the material is covered by patents and whether or not it is licensed and, if licensed, the limitations on its manufacture.

Page 181

IV-1400 CODE CASE

In exceptional circumstances, the Code will consider the issuance of a Code Case, effective for a period of 3 years, permitting the use of a material provided the following conditions are met.

- (a) The material is commercially available and can be purchased within the specified range of chemical, physical, and mechanical requirements described in IV-1210 through IV-1240.
- (b) The inquirer shows that there will be a reasonable demand for the material by industry and that there exists an urgency for approval by means of a Code Case.
- (c) The request for approval of the material shall clearly describe it in ASTM specification form for the particular product.
- (d) The inquirer shall furnish all the data specified in IV-1200 and IV-1300.

July 1, 1998

American Society Of Mechanical Engineers

SEC III D2 MA APP VI

APPENDIX VI ROUNDED INDICATIONS

Page 183

ARTICLE VI-1000 ROUNDED INDICATIONS

VI-1100 ACCEPTANCE STANDARDS FOR RADIOGRAPHICALLY DETERMINED ROUNDED INDICATIONS IN WELDS

VI-1110 APPLICABILITY OF THESE STANDARDS

These standards are applicable to ferritic, austenitic, and nonferrous material.

VI-1120 TERMINOLOGY

VI-1121 Rounded Indications

Indications with a maximum length of three times the width or less on the radiograph are defined as *rounded indications*. These indications may be circular, elliptical, conical, or irregular in shape and may have tails. When evaluating the size of an indication, the tail shall be included. The indication may be from any source in the weld, such as porosity, slag, or tungsten.

VI-1122 Aligned Indications

A sequence of four or more rounded indications shall be considered to be aligned when they touch a line parallel to the length of the weld drawn through the center of the two outer rounded indications.

VI-1123 Thickness t

t is the thickness of the weld, of the pressure retaining material, or of the thinner of the sections being joined, whichever is least. If a full penetration weld includes a fillet weld, the thickness of the fillet weld throat shall be included in t .

VI-1130 ACCEPTANCE CRITERIA

VI-1131 Image Density

Density within the image of the indication may vary and is not a criterion for acceptance or rejection.

VI-1132 Relevant Indications

(See Table VI-1132-1 for Examples)

Only those rounded indications which exceed the following dimensions shall be considered relevant:

- (a) $\frac{1}{10}t$ for t less than $\frac{1}{8}$ in. (3.2 mm);
- (b) $\frac{1}{64}$ in. (0.4 mm) for t equal to $\frac{1}{8}$ in. to $\frac{1}{4}$ in. (3.2 mm to 6 mm), incl.;
- (c) $\frac{1}{32}$ in. (0.8 mm) for t greater than $\frac{1}{4}$ in. to 2 in. (6 mm to 51 mm), incl.;
- (d) $\frac{1}{16}$ in. (1.6 mm) for t greater than 2 in. (51 mm).

VI-1133 Maximum Size of Rounded Indication (See Table VI-1132-1 for Examples)

The maximum permissible size of any indication shall be $\frac{1}{4}t$ or $\frac{5}{32}$ in. (4 mm), whichever is less, except that an isolated indication separated from an adjacent indication by 1 in. (25 mm) or more may be $\frac{1}{32}t$ or $\frac{1}{4}$ in. (6 mm), whichever is less. For t greater than 2 in. (51 mm), the maximum permissible size of an isolated indication shall be increased to $\frac{3}{8}$ in. (10 mm).

VI-1134 Aligned Rounded Indications

Aligned rounded indications are acceptable when the summation of the diameters of the indications is less than t in a length of $12t$ (see Fig. VI-1134-1). The length of groups of aligned rounded indications and the spacing between the groups shall meet the requirements of Fig. VI-1134-2.

Page 184

VI-1135 Spacing

The distance between adjacent rounded indications is not a factor in determining acceptance or rejection, except as required for isolated indications or groups of aligned indications.

VI-1136 Rounded Indication Charts

- (a) The rounded indications as determined from the radiographic film shall not exceed that shown in the charts.
- (b) The charts in Figs. VI-1136-1 through VI-1136-6 illustrate various types of assorted, randomly dispersed, and clustered rounded indications for different weld thicknesses greater than $\frac{1}{8}$ in. (3.2 mm). These charts represent the maximum acceptable concentration limits for rounded indications.
- (c) The chart for each thickness range represents full-scale 6 in. radiographs and shall not be enlarged or reduced. The distributions shown are not necessarily the patterns that may appear on the radiograph, but are typical of the concentration and size of indications permitted.

VI-1137 Weld Thickness t Less Than $\frac{1}{8}$ in. (3.2 mm)

For t less than $\frac{1}{8}$ in. (3.2 mm), the maximum number of rounded indications shall not exceed 12 in a 6 in. (152 mm) length of weld. A proportionally fewer number of indications shall be permitted in welds less than 6 in. (152 mm) in length.

TABLE VI-1132-1
MAXIMUM SIZE OF NONRELEVANT INDICATIONS
AND ACCEPTABLE ROUNDED INDICATIONS—
EXAMPLES ONLY

SEC III D2 MA APP VII

APPENDIX VII QUALIFICATIONS OF CONCRETE INSPECTION
PERSONNEL

ARTICLE VII-1000 INTRODUCTION

VII-1100 SCOPE

This Appendix defines the qualifications of personnel, except Authorized Inspectors, who perform concrete inspection and testing.

VII-1200 RESPONSIBILITY

(a) It is the responsibility of the N-type Certificate Holder to ensure that only those personnel who meet the requirements of this Appendix are permitted to perform concrete inspection and testing.

(b) The N-type Certificate Holder responsible for establishing the applicable requirements for personnel performing activities covered by this Appendix shall identify and document the scope of the responsibility of such personnel. The work of establishing training practices and certification procedures and providing the resources in terms of personnel, equipment, and services necessary to implement the requirements of this Appendix may be subcontracted to other organizations, and such contractual relationships shall also be documented.

(c) It is the responsibility of each organization performing concrete inspection and testing to assure that their personnel are certified in accordance with this Appendix.

(d) The organization certifying concrete inspection and testing personnel shall make available for review the detailed methods and procedures used for meeting these requirements. These methods and procedures shall be reviewed and approved by the N-type Certificate Holder.

ARTICLE VII-2000 GENERAL REQUIREMENTS

VII-2100 PLANNING

Plans shall be developed for assigning or staffing and training an adequate number of personnel to perform the required concrete inspections and tests, and these plans shall reflect the schedule of project activity so as to allow adequate time for assignment for selection and training of the required personnel. The need for formal training programs shall be determined, and such training activities shall be conducted as required to qualify personnel responsible for concrete inspection and testing.

VII-2200 CERTIFICATION

Personnel who perform concrete inspection and tests shall be certified by their employer as being qualified to perform the assigned work. This certification shall be supported by appropriate measures such as training, testing, evaluation, and periodic review to assure the initial and continued proficiency of each person.

VII-2210 TRAINING

Training programs shall include indoctrination of personnel with the technical objectives of the project and the codes and standards that are to be used. On-the-job participation shall also be included in the program with emphasis on first-hand experience gained through actual performance of tests, examinations, and inspections. Classroom and on-the-job training may be waived by the Level III Concrete Inspector for concrete inspection and testing personnel with sufficient experience to satisfactorily pass the evaluation (performance or written examination) requirements for the job description.

Page 194

The justification for waiver shall be stated and included in the certification file (VII-2230).

VII-2220 EVALUATION OF PERFORMANCE

(a) The education, experience, and training of Level I and II concrete inspection personnel shall be evaluated prior to initial certification by a Level III Concrete Inspector, and their performance shall also be evaluated at periodic intervals not to exceed 2 years. The N-type Certificate Holder shall review and approve the initial qualifications and periodic

evaluations of concrete inspection and testing personnel.

(b) The qualifications of the Level III Concrete Inspector shall be initially reviewed by the N-type Certificate Holder responsible for designating the Level III Concrete Inspector. The applicant's education, experience, and satisfactory passing of the Level III Concrete Inspector examination shall be evaluated to determine if the results meet the requirements of Appendix VII, the applicant may be certified by his employer.

(c) The performance of Level III Concrete Inspectors shall be reevaluated by the N-type Certificate Holder responsible for designating them at periodic intervals not to exceed 2 years.

(d) A Level III Concrete Inspector who has not been certified or recertified as a Level III Concrete Inspector for a period of 5 years following satisfactory passing of the concrete inspector examinations shall satisfactorily pass another examination to demonstrate current knowledge of concrete practice and this Division.

(e) Level III Concrete Inspectors may file copies of their certification and periodic reevaluation with the American Concrete Institute, Director of Education. This information, together with the original application and notice of passing the Level III examination, would be released, upon request from the individual, to subsequent employers for verification of total experience and performance as a Level III Concrete Inspector.

VII-2230 CERTIFICATION OF QUALIFICATION

(a) The qualifications of Level I and II concrete inspection and testing personnel shall be documented in an appropriate form. The certification file shall include the following information:

(1) employer's name;

(2) name of person being certified;

(3) level of capability;

(4) activity certified to perform, including ASTM test numbers or other test identifications and inspection or testing functions described in VII-4210 or VII-4220;

(5) basis used for certification:

(a) record of education and experience

(b) test results

(c) proficiency demonstration, when applicable

(d) record of training including on-the-job training;

(6) results of periodic evaluation;

(7) results of required physical examinations;

(8) signature of employee's designated Level III Concrete Inspector;

(9) issue date and expiration date of the certification.

(b) The qualifications of Level III Concrete Inspectors shall be documented in an appropriate form. The certification file shall contain the following information:

(1) employer's name;

(2) signature of employer certifying the person as a Level III Concrete Inspector;

(3) signature of the N-type Certificate Holder responsible for reviewing the person's qualifications;

(4) copy of completed application for Level III Concrete Inspector;

(5) proof of satisfactory passing of the Level III Concrete Inspector examination;

- (6) result of required physical examinations;
- (7) results of periodic evaluations;
- (8) certificate issue date and expiration date of the certification.

ARTICLE VII-3000 QUALIFICATIONS

VII-3100 GENERAL REQUIREMENTS

(a) It shall be the responsibility of the N-type Certificate Holder to ensure that all personnel performing concrete inspection and testing operations are competent in and knowledgeable of the applicable or concrete inspection requirements to the degree specified.

(b) All concrete inspections and tests shall be performed and the results evaluated by qualified concrete inspection or testing personnel. The assignment of responsibilities to individual personnel will be at the discretion of the N-type Certificate Holder.

Page 195

VII-3200 QUALIFICATION OF CONCRETE INSPECTION AND TESTING PERSONNEL

VII-3210 QUALIFICATIONS

Three qualification levels for personnel who perform concrete inspection and testing activities are defined below.

VII-3211 Level I Concrete Inspection and Testing Technician

A candidate for Level I Concrete Inspection and Testing Technician must satisfactorily complete each of the following:

(a) Completion with passing grades of at least 2 years of engineering or science study at an accredited university, college, or technical institute, plus 3 months experience in inspection or testing; or high school graduation (GED equivalency) plus six months experience in inspection or testing. At least $\frac{1}{2}$ of the required experience shall be in concrete inspection or testing.

(b) An indoctrination course including subjects such as the requirements of this Division and quality programs applicable to the Candidate.

(c) Combined classroom and on-the-job training for each inspection and testing function to be performed. This training may be reduced for experienced candidates. This training shall be administered by a certified Level II or Level III person. Satisfactory performance shall be documented.

(d) Passing of a written "closed book" examination which includes each inspection and test the Candidate is to perform. The examination content shall be approved by a Level III Concrete Inspector. The examination shall be administered by a certified Level II or Level III person. Satisfactory passing of the examination shall be evaluated for each applicant by a Level III Concrete Inspector.

(e) Passing of a proficiency demonstration for each test the candidate is to perform. The proficiency demonstration shall be administered and evaluated for each candidate by a certified Level II or III person.

VII-3212 Level II Concrete Inspector

A candidate for Level II Concrete Inspector must satisfactorily complete each of the following:

(a) Graduation with an engineering or science degree from a four year accredited engineering or science college or university, plus six months of experience in concrete inspection and testing; or, completion with passing grades of at least 2 years of engineering or science study at an accredited university, college, or technical institute plus one year of experience in concrete inspection and testing; or, high school graduation (GED equivalency) plus 2 years of satisfactory performance as a certified Level I Concrete Inspection Technician.

(b) An indoctrination course including subjects such as applicable quality programs, Code requirements, quality records, duties, and responsibilities that are pertinent to the Candidate's assignment.

(c) Training that includes each inspection and testing function to be performed. This training may be reduced for experienced candidates. This training shall be administered by a certified Level II or Level III person. Satisfactory performance shall be documented.

(d) Passing of a written examination which includes each inspection and test the candidate is to perform. The examination content shall be approved by a Level III Concrete Inspector. The examination shall be administered by a certified Level II or Level III person. Satisfactory passing of the examination shall be evaluated for each applicant by a Level III Concrete Inspector.

(e) Passing of a proficiency demonstration for each test the Candidate is to perform. The proficiency demonstration shall be administered and evaluated for each Candidate by a certified Level II or Level III person.

VII-3213 Level III Concrete Inspector

To be considered for certification, a candidate must satisfy one of the following requirements:

(a) graduation from a 4 year accredited engineering or science college or university, plus 4 years experience in an assignment comparable or superior to that of Level II Concrete Inspector, plus being a registered Professional Engineer, plus satisfactory passing of the Level III Concrete Inspector examination administered by the American Concrete Institute;

(b) completion with passing grades of at least 2 years of engineering or science study at an accredited university, college, or technical institute, plus 7 years or more experience in an assignment comparable or superior to that of Level II Concrete Inspector, plus being a registered Professional Engineer, plus satisfactory passing of the Level III Concrete Inspector examination as administered by the American Concrete Institute;

(c) completion with passing grades of 2 or more years of engineering or science study at an accredited university, college, or technical institute plus 8 years or more experience in an assignment comparable or superior to that of Level III Concrete Inspector, plus

Page 196

satisfactory passing of the Level III Concrete Inspector examination as administered by the American Concrete Institute.

VII-3220 PHYSICAL CAPABILITIES

Personnel who perform concrete inspection and tests shall be physically capable of performing their assigned task. As a minimum, the required characteristics are as follows:

(a) natural or corrected near distance acuity capable of reading J-I letters on standard Jaeger's test type chart for near vision or equivalent test type;

(b) natural or corrected far distance acuity capable of reading 20-40 by the Linear Snellen Scale;

(c) color vision, as applicable.

The required physical characteristics should be verified by examination at intervals not to exceed 2 years.

VII-3230 TECHNICAL

Three levels of technical requirements for personnel who perform concrete inspection and test activities are defined below.

VII-3231 Level I

The person shall have experience or training in the performance of the inspection and tests that he is required to perform. He shall be familiar with the tools and equipment to be employed and shall have demonstrated proficiency in

their use. He shall be familiar with inspection and testing equipment calibration and control methods and shall be capable of verifying that the equipment is in proper condition for use.

VII-3232 Level II

The person shall have experience or training in the performance of required inspections and tests and in the completion and evaluation of the results of the inspections and tests. He shall be capable of supervising or maintaining surveillance over the inspections and tests performed by others and of calibrating or establishing validity of calibration of testing equipment. He shall have demonstrated proficiency in planning and setting up tests and shall be capable of determining the validity of tests results.

VII-3233 Level III

The person shall have broad experience and formal training in the performance of inspections and tests and shall be educated through formal courses of study in the principles and techniques of the inspections and tests that are to be performed. He shall be capable of planning and supervising inspections and tests, reviewing and approving procedures, and evaluating the adequacy of activities to accomplish objectives. He shall be capable of organizing and reporting results and of certifying the validity of results.

ARTICLE VII-4000 PERFORMANCE

VII-4100 CONCRETE INSPECTION AND TESTING FUNCTIONS

Personnel who are assigned the responsibility and authority to perform inspections and tests shall have the level of capability shown in Table VII-4100-1.

VII-4200 CONCRETE INSPECTION AND TESTING FUNCTIONS

VII-4210 LEVEL I

A person performing one or more of the following functions shall hold, as a minimum, Level I certification:

- (a) routine tests of concrete and concrete constituents;
- (b) inspection and testing of mechanical reinforcing bar splices;
- (c) receiving inspection and testing of concrete constituents, reinforcing material, post tensioning systems, and embedments;
- (d) inspection of finishing, patching, and curing of concrete;
- (e) preparation of reports of the above functions.

VII-4220 LEVEL II

A person performing one or more of the following functions shall hold, as a minimum, Level II certification:

- (a) inspection at the batching plant;
- (b) preplacement inspection of forms, reinforcing steel, embedded items, and prestressing systems;
- (c) inspection of concrete handling and placing equipment and its operation;

**TABLE VII-4100-1
MINIMUM LEVELS OF CAPABILITY FOR FUNCTIONS**

Function	Level		
	L-I	L-II	L-III
Recording inspection and testing data	X	X	X
Implementing inspection and testing procedures	X	X	X
Planning inspections and tests: setting up tests including preparation and setup of related equipment		X	X
Evaluating the validity and acceptability of inspection and testing results		X	X
Reporting inspection and testing results		X	X
Supervising equivalent or lower level personnel		X	X
Certifying lower level personnel			X
Evaluating the adequacy of specific programs used to train and test inspection and testing personnel			X
Approve inspection and test procedures			X

TABLE VII-4100-1 MINIMUM LEVELS OF CAPABILITY FOR FUNCTIONS

- (d) inspection of concrete placement including provisions for weather protection;
- (e) inspection of structural repairs to concrete members;
- (f) inspection of insertion, stressing, and greasing of prestressing systems;
- (g) inspection of precasting operations;
- (h) specialized laboratory tests;
- (i) supervision of Level I personnel including review and approval of reports;
- (j) preparation, review, and approval of inspection and test reports prepared by Level I personnel;
- (k) training and administering examinations to Level I and II personnel.

VII-4230 LEVEL III

A person performing one or more of the following functions shall hold Level III certification:

- (a) witnessing and evaluation of laboratory design or testing of concrete mixes as required by the Construction

Specification;

- (b) approval of batching and mixing facilities;
- (c) approval of quality control inspection and test procedures; y
- (d) development of training and certification programs for Level I and II personnel;
- (e) evaluation of Level I and II certification examinations;
- (f) certification of Level I and II personnel.

ARTICLE VII-5000 REVIEW OF QUALIFICATIONS

VII-5100 RECORDS OF QUALIFICATIONS

A file of records of personnel qualifications shall be established and maintained during construction. This file shall contain records of past performance history, training, initial and periodic evaluations, and certification of the qualifications of each person.

Page 198

VII-5200 CERTIFICATION OF CONCRETE INSPECTION PERSONNEL

The Authorized Inspector has the duty to verify the certification of concrete inspection personnel in accordance with VII-3000. He shall have the prerogative to audit the program and require recertification of any inspector when the Authorized Inspector has reason to question the capabilities of that concrete inspector.

July 1, 1998

American Society Of Mechanical Engineers

SEC III D2 MA APP IX

APPENDIX IX NONDESTRUCTIVE EXAMINATION METHODS

Page 199

ARTICLE IX-1000 INTRODUCTION

IX-1100 SCOPE

This Appendix includes the requirements for those nondestructive examination methods not contained in Section V and the corresponding qualification requirements.

ARTICLE IX-2000 VACUUM BOX EXAMINATION OF WELDS

IX-2100 SCOPE

These rules describe the methods which shall be employed whenever vacuum box examination is specified.

IX-2200 APPLICATION

Vacuum box examination provides for the detection of through-thickness discontinuities in welds. Typical discontinuities detectable by this method are cracks, pores, and lack of fusion. A bubble-forming solution is applied to the surface to be examined. A vacuum box with a viewing window large enough to view the complete area and to allow sufficient light to enter the box for proper examination is then placed over the surface. The box, which by means of its construction and a suitable gasket shall be capable of producing and holding a pressure differential of at least 8 psi, is then evacuated. A calibrated gauge is placed in the system to verify the required pressure differential to detect vacuum seal or other types of leaks in the equipment. The area is then viewed for evidence of through-thickness discontinuities by the formation of bubbles on the surface.

IX-2300 PROCEDURE

IX-2310 SURFACE PREPARATION

In general, satisfactory results may be obtained when the surface is in the as-welded condition.

(a) Prior to vacuum box examination, the surface to be examined shall be cleaned of all slag, scale, grease, paint, or other material which would otherwise interfere with the examination procedure or the interpretation of the results.

(b) Typical cleaning agents which may be used are wire brushes, detergents, organic solvents, descaling solutions, and paint removers.

IX-2320 DRYING AFTER CLEANING

After wet cleaning, the surfaces to be examined may be dried by normal evaporation or with forced hot air. A minimum period of time shall be established and included in the written procedure to ensure that the cleaning solvents have evaporated prior to the application of the bubble solution.

IX-2330 BUBBLE SOLUTION APPLICATION

The bubble solution shall be applied evenly over the entire test area by using brushes or other applicable means.

IX-2340 SOLUTION APPLICATION TIME

Application time is critical, particularly if the surface is warm. At temperatures between 40°F and 100°F,

Page 200

the solution shall not be applied more than 1 min prior to examination.

IX-2350 TEMPERATURE OF SURFACE BEING EXAMINED

As a standard technique, the temperature of the surface of the part to be examined shall not be below 40°F (4°C) nor above 100°F (38°C) throughout the examination. Local heating or cooling is permitted provided temperatures remain in the range of 40°F to 100°F (4°C to 38°C) during examination. Where it is impractical to comply with the foregoing temperature limitations, other temperatures may be used, provided the procedure is qualified as described in IX-2500.

IX-2360 APPLICATION OF VACUUM

The vacuum box shall be placed over the examination area and evacuated to at least 5 psi (35 kPa) pressure differential with respect to atmospheric pressure. The 5 psi (35 kPa) pressure differential shall be verified by the gauge and maintained for a minimum time of 20 sec after the vacuum has been obtained. An overlap of 2 in. (51 mm) shall be used for each subsequent examination along the seam.

IX-2370 VISUAL EXAMINATION

When performing the visual examination, access to the area to be viewed should permit placing the eye within at least 24 in. (610 mm) of the surface being examined. Mirrors may be used to improve the angle of vision, and aids such as magnifying lenses may be used. The lighting in the area to be examined shall be a minimum of 350 lux.

IX-2400 EVALUATION OF INDICATIONS

All indications of bubbles shall be evaluated in terms of the acceptance standards.

IX-2500 PROCEDURE SPECIFICATION REQUIREMENTS

(a) Each Fabricator or Constructor shall certify that the required written examination procedure specification is in accordance with applicable requirements of this Division and IX-2000. The required procedure specification shall record, in detail, at least the following information:

- (1) brand name and specific type (number or letter designation, if available) of bubble solution;
- (2) details of the method of preexamination drying, including cleaning materials used and the time allowed for drying;
- (3) method of assuring that the required differential pressure is present;
- (4) details of the method of bubble solution application, the length of time that the solution remains on the surface prior to examination, and the temperature of the surface during the examination if not within the 40°F and 100°F (4°C to 38°C) range;
- (5) method of postexamination cleaning, if performed.

IX-2600 RECORDS

Copies of procedure and personnel qualifications and examination results shall be maintained in accordance with the requirements of NCA-4134.17(e)(8).

American Society Of Mechanical Engineers

SEC III D2 MA APP X

APPENDIX X PREPARATION OF TECHNICAL INQUIRIES TO THE BOILER AND PRESSURE VESSEL COMMITTEE

Page 201

X-1000 INTRODUCTION

The ASME Boiler and Pressure Vessel Committee and its Subcommittees, Subgroups, and Working Groups meet regularly to consider revisions of the Code rules, new Code rules as dictated by technological development, Code Cases, and Code interpretations. This Appendix provides guidance to Code users for submitting technical inquiries to the Committee. Technical inquiries include requests for revisions or additions to the Code rules, requests for Code Cases, and requests for Code interpretations.

Code Cases may be issued by the Committee when the need is urgent. Code Cases clarify the intent of existing Code requirements or provide alternative requirements. Code Cases are written as a question and a reply and are usually intended to be incorporated into the Code at a later date. Code interpretations provide the meaning of or the intent of existing rules in the Code and are also presented as a question and a reply. Both Code Cases and Code interpretations are published by the Committee.

The Code rules, Code Cases, and Code interpretations established by the Committee are not to be considered as approving, recommending, certifying, or endorsing any proprietary or specific design or as limiting in any way the freedom of manufacturers or constructors to choose any method of design or any form of construction that conforms to the Code rules.

As an alternate to the requirements of this Appendix, members of the Committee and its Subcommittees, Subgroups, and Working Groups may introduce requests for Code revisions or additions, Code Cases, and Code interpretations at their respective committee meetings or may submit such requests to the secretary of a Subcommittee, Subgroup, or Working Group.

Inquiries that do not comply with the provisions of this Appendix or that do not provide sufficient information for the Committee's full understanding may result in the request being returned to the inquirer with no action.

X-2000 INQUIRY FORMAT

Submittals to the Committee shall include:

(a) *Purpose.* Specify one of the following:

(1) Revision of present Code rules(s)

(2) New or additional Code rules(s)

(3) Code Case

(4) Code interpretation

(b) *Background*. Provide the information needed for the Committee's understanding of the inquiry, being sure to include reference to the applicable Code Section, Division, Edition, Addenda, paragraphs, figures, and tables. Preferably, provide a copy of the specific referenced portions of the Code.

(c) *Presentations*. The inquirer may desire or be asked to attend a meeting of the Committee to make a formal presentation or to answer questions from the Committee members with regard to the inquiry. Attendance at a Committee meeting shall be at the expense of the inquirer. The inquirer's attendance or lack of attendance at a meeting shall not be a basis for acceptance or rejection of the inquiry by the Committee.

X-3000 CODE REVISIONS OR ADDITIONS

Requests for Code revisions or additions shall provide the following:

Page 202

(a) *Proposed Revision(s) or Addition(s)*. For revisions, identify the rules of the Code that require revision and submit a copy of the appropriate rules as they appear in the Code marked up with the proposed revision. For additions, provide the recommended wording referenced to the existing Code rules.

(b) *Statement of Need*. Provide a brief explanation of the need for the revision(s) or addition(s).

(c) *Background Information*. Provide background information to support the revision(s) or addition(s) including any data or changes in technology that form the basis for the request that will allow the Committee to adequately evaluate the proposed revision(s) or addition(s). Sketches, tables, figures, and graphs should be submitted as appropriate. When applicable, identify any pertinent paragraph in the Code that would be affected by the revision(s) or addition(s) and paragraphs in the Code that reference the paragraphs that are to be revised or added.

X-4000 CODE CASES

Requests for Code Cases shall provide a *Statement of Need* and *Background Information* similar to that defined in V-3000(b) and V-3000(c), respectively, for Code revisions or additions. The proposed Code Case should identify the Code Section and division and be written as a *Question* and a *Reply* in the same format as existing Code Cases. Requests for Section XI Code Cases should also indicate the applicable Code Edition(s) and Addenda to which the proposed Code Case applies.

X-5000 CODE INTERPRETATIONS

Requests for Code interpretations shall provide the following:

(a) *Inquiry*. Provide a condensed and precise question, omitting superfluous background information, and, when possible, composed in such a way that a "yes" or "no" *Reply*, possibly with brief provisos, is acceptable. The question should be technically and editorially correct.

(b) *Reply*. Provide a proposed *Reply* that will clearly and concisely answer the *Inquiry* question. Preferably, the *Reply* should be "yes" or "no" possibly with brief provisos.

(c) *Background Information*. Provide any background information that will assist the Committee in understanding the proposed *Inquiry* and *Reply*.

X-6000 SUBMITTALS

Submittals to and responses from the Committee shall meet the following:

(a) *Submittal*. Inquiries from Code users shall preferably be submitted in typewritten form; however, legible handwritten inquiries will also be considered. They shall include the name, address, telephone number, and fax number, if available, of the inquirer and be mailed to the following address:

Secretary
ASME Boiler and Pressure Vessel Committee
Three Park Avenue
New York, N.Y. 10016-5990

(b) Response. The Secretary of the ASME Boiler and Pressure Vessel Committee or of the appropriate Subcommittee shall acknowledge receipt of each properly prepared inquiry and shall provide a written response to the inquirer upon completion of the requested action by the Code Committee.

APPENDIX XI QUALIFICATIONS FOR ARC WELDING REINFORCING BARS

Page 203

ARTICLE XI-1000 INTRODUCTION

XI-1100 SCOPE

This Appendix defines the qualifications of arc welding procedures, welders, and welding operators used to arc weld reinforcing bars to reinforcing bars or to other material.

XI-1200 APPLICATION

Arc welded joints are permissible provided the requirements of CB-2333 or CC-2333, as applicable, are met.

XI-1300 QUALIFICATIONS, RECORDS, AND IDENTIFYING STAMPS

XI-1310 REQUIRED QUALIFICATIONS

Each Constructor or Fabricator is responsible for the welding performed by his organization. The Constructor or Fabricator shall conduct the tests required to qualify the welding procedures and the welders and welding operators who use these procedures.

XI-1320 MAINTENANCE AND CERTIFICATION OF RECORDS

The Constructor or Fabricator shall maintain a record of the qualified welding procedures and of the welders and welding operators qualified and employed by him. These records shall show the date and results of tests and the identification mark assigned to each welder or welding operator. These records shall be reviewed, verified, and signed by the Constructor or Fabricator and shall be accessible to the Owner and to the Inspector.

XI-1330 IDENTIFICATION OF JOINTS WELDED BY WELDERS AND WELDING OPERATORS

The welder or welding operator shall apply the identification mark assigned to him by the Constructor or Fabricator adjacent to each welded joint. As an alternative, the Constructor or Fabricator shall keep a record of permanent welded joints in each item and of the welders and welding operators used in making each of the joints.

XI-1340 WELDING PRIOR TO QUALIFICATION

No production welding shall be performed by a welder or welding operator who has not been qualified in accordance with XI-1540.

XI-1350 TRANSFERRING QUALIFICATIONS

The performance qualification tests for welders and welding operators conducted by one Constructor or Fabricator shall not qualify welders and welding operators to weld for any other Constructor or Fabricator.

XI-1400 GENERAL WELDING REQUIREMENTS

XI-1410 WELDING PROCESS AND MATERIAL

Welding of reinforcing bar shall be restricted to the shielded metal-arc (SMAW), gas metal-arc (GMAW), or flux-cored arc welding (FCAW) processes. Weld metal shall conform to the following requirements.

Page 204

**TABLE XI-1410-1
FILLER METAL REQUIREMENTS**

Base Metal	Electrode Classifications for Welding Processes		
	Shielded Metal-Arc Welding (Low Hydrogen Electrode) (XI-1411)	Gas Metal-Arc Welding (XI-1412)	Flux-Cored Arc Welding (XI-1412)
ASTM A 615 Grade 40	AWS A5.1 or A5.5 E70XX	AWS A5.18 E70S-X, E70U-1	AWS A5.20 E70T-X
ASTM A 706	AWS A5.5 E80XX	AWS A5.28 ER 80S-B2, ER 80S-B2L	AWS A5.20 E80T
ASTM A 615 Grade 60, ASTM A 706	AWS A5.5 E90XX	AWS A5.28 ER90S-B3, ER90S-B3L	AWS A5.20 E90T

TABLE XI-1410-1 FILLER METAL REQUIREMENTS

XI-1411 SMAW Process

The electrode, electrode-gas combination, or grade of weld metal shall be in accordance with Table XI-1410-1. Shielded metal-arc welding shall be performed with low hydrogen electrodes.

XI-1411.1

Low hydrogen electrodes for shielded metal-arc welding shall conform to the requirements of AWS A5.1, Specification for Covered Carbon Steel Arc Welding Electrodes, or to the requirements of AWS A5.5, Specification for Low Alloy Steel Covered Arc Welding Electrodes.

XI-1411.2

All electrodes having low hydrogen coverings conforming to AWS A5.1 shall be purchased in hermetically sealed containers or shall be dried for at least 2 hr at a temperature between 450°F (232°C) and 500°F (260°C) before they are used. Electrodes having a low hydrogen covering conforming to AWS A5.5 shall be purchased in hermetically sealed containers or shall be dried for at least 1 hr at a temperature between 700°F (371°C) and 800°F (427°C) before they are used. Electrodes shall be dried prior to use if the hermetically sealed containers show evidence of damage. After removal from hermetically sealed containers or drying ovens, electrodes shall be stored in ovens held at a temperature of at least 250°F (121°C).

E70XX electrodes that are not used within 4 hr, E80XX within 2 hr, and E90XX within 1 hr after removal from hermetically sealed containers (or removal from a drying or storage oven) shall be redried before use. Electrodes which have been wet shall not be used.

XI-1412 GMAW or FCAW Process

The electrodes and combination of shielding for GMAW or FCAW for producing weld metal with minimum specified yield strengths of 60 ksi (410 MPa) or less shall conform to the requirements of AWS A5.18, Specification for Carbon Steel Filler Metals for Gas Shielded Arc Welding, or AWS A5.20, Specification for Carbon Steel Electrodes for Flux Cored Arc Welding, as applicable.

For weld metal having a minimum specified yield strength greater than 60 ksi (410 MPa) for GMAW, the weld material shall conform to AWS A5.28, Specification for Low Alloy Steel Filler Metals for Gas Shielded Arc Welding. For FCAW, each user shall demonstrate that each combination of electrode and shielding proposed for use will produce low alloy weld metal having the mechanical properties listed as follows.

FCAW Grade E80T

Tensile strength, psi (minimum)	80,000
Yield strength, psi (minimum)	65,000
Elongation in 2 in., % (minimum)	18

FCAW Grade E90T

Tensile strength, psi (minimum)	90,000
Yield strength, psi (minimum)	78,000
Elongation in 2 in., % (minimum)	17

TABLE

XI-1412.1

The mechanical properties shall be determined from a multiple-pass weld made in accordance with the test requirements of AWS A5.18, AWS A5.20, or AWS A5.28, as applicable.

Page 205

XI-1412.2 Shielding Gas.

When a gas or a gas mixture is used for shielding in gas metal-arc or flux-cored arc welding, it shall be of a welding grade having a dew point of -40°F (-4°C) or lower.

XI-1420 WELD JOINT DESIGN

Only direct butt splices and attachments to steel elements as shown in Fig. XI-1420-1 are permitted.

A *direct butt splice* is defined as a weld between two steel elements whose axes are essentially in alignment to minimize eccentricities. The steel elements are joined by a full penetration groove weld.

XI-1430 CARBON EQUIVALENT COMPUTATION AND PREHEAT AND INTERPASS REQUIREMENTS

The carbon equivalent (CE) of the heat of reinforcing bar shall be computed from the actual heat analysis using the following formula:

$$CE = \%C + (\%Mn/6) + (\%Cu/40) + (\%Ni/20) + (\%Cr/10) - (\%Mo/50) - (\%V/10)$$

Based on the calculated CE value, the minimum preheat and interpass temperatures shall be those required by Table XI-1430-1.

XI-1500 PROCEDURE QUALIFICATION REQUIREMENTS

XI-1510 GENERAL REQUIREMENTS

The procedure qualification tests shall be made on test joints which simulate the conditions to be used in production. Welding of reinforcing bar joints and reinforcing bars to steel elements shall be performed in accordance with written procedures established for each combination of specification and grade of reinforcing bar and steel elements to be welded.

XI-1520 ESSENTIAL VARIABLES

Welding procedure changes shall require requalification if an essential variable is changed. The qualification joints shall be made using a bar identical to that to be used in production. The largest bar size having the highest carbon equivalent number as determined by XI-1430 shall be used for qualification tests. For arc welding processes, the following changes shall be considered changes in essential variable.

XI-1521 Shielded Metal-Arc Welding (SMAW)

- (a) A change increasing filler metal strength level, e.g., a change from E70XX to E80XX, but not vice versa.
- (b) An increase in the diameter of the electrode used over that called for in the procedure specification.
- (c) A change of electrode amperage and/or voltage that is not within the ranges recommended by the electrode Manufacturer.
- (d) A change in position in which welding is done as defined in Fig. XI-1520-1.
- (e) A change in the type of groove, e.g., a change from a single-Vee to a double-Vee groove.
- (f) A change in the shape of any one type of groove involving the following:
 - (1) a decrease in the included angle of the groove exceeding 5 deg.;
 - (2) a decrease in the root opening of the groove exceeding $\frac{1}{16}$ in.;
 - (3) an increase in the root face of the groove exceeding $\frac{1}{16}$ in.;
 - (4) the omission, but not inclusion, of backing material.
- (g) A decrease of more than 10% in the preheat or interpass temperature. In any case, the preheat or interpass temperature shall not be less than that specified in Table XI-1430-1.
- (h) A change from uncoated to galvanized reinforcing bar.
- (i) An increase of more than one bar size.
- (j) An increase in the carbon equivalent number calculated by XI-1430.

XI-1522 Gas Metal-Arc Welding (GMAW) and Flux-Cored Arc Welding (FCAW)

(a) A change in electrode or method of shielding not covered by AWS A5.18 (GMAW), AWS A5.20 (FCAW), or AWS A5.28 (FCAW).

(b) A change increasing filler metal strength level, e.g., a change from E70S to E80S, but not vice versa.

(c) A change in electrode diameter for GMAW, or an increase in the diameter of electrode used over that called for in the procedure specification for FCAW.

(d) A change from a single gas to any other single gas or to a mixture of gases, or a change in specified composition of gas mixture not covered by AWS A5.18, AWS A5.20, or AWS A5.28.

Page 206

Page 207

FIG. XI-1420-1 TYPICAL DIRECT BUTT SPLICES

FIG. XI-1420-1 TYPICAL DIRECT BUTT SPLICES

**TABLE XI-1430-1
MINIMUM PREHEAT AND INTERPASS REQUIREMENTS**

Carbon Equivalent Range, %	Size of Reinforcing Bar	Minimum Preheat and Interpass Temperature, °F [Notes (1)–(3)]
0.40 max.	Up to 11, incl. 14 and 18	None [Note (4)] 50
0.41–0.45, incl.	Up to 11, incl. 14 and 18	None [Note (4)] 100
0.46–0.55, incl.	Up to 6, incl. 7 to 11, incl. 14 and 18	None [Note (4)] 50 200

NOTES:

- (1) When reinforcing steel is to be welded to liner plates or other steels permitted by Table I-2.1, the preheat and interpass requirements of both steels shall be considered. The minimum preheat and interpass requirement to apply in this situation shall be the higher requirement of the two materials being joined. When welding reinforcing steel to quenched and tempered steels, the preheat and interpass requirements for both materials must be satisfied or welding shall not be used.
- (2) Welding is not permitted when the ambient temperature is lower than 0°F. When the base metal is below the temperature listed for the welding process being used and the size and carbon equivalent range of the bar being welded, it shall be preheated (except as otherwise provided) in such a manner that the cross section of the bar, for not less than 6 in. on each side of the joint, shall be at or above the specified minimum temperature. Preheat and interpass temperatures must be sufficient to prevent crack formation.
- (3) After welding is complete, bars shall be allowed to cool naturally to ambient temperature. Accelerated cooling is prohibited.
- (4) When the base metal is below 32°F, preheat the base metal to at least 70°F and maintain this minimum temperature during welding.

TABLE XI-1430-1 MINIMUM PREHEAT AND INTERPASS REQUIREMENTS

- (e) A change of more than 10% above or below the specified mean amperage for each size electrode used.
- (f) A change of more than 7% above or below the specified mean arc voltage for each size electrode used.
- (g) A change of more than 10% above or below the specified mean travel speed.
- (h) An increase of 25% or more or a decrease of 10% or more in the rate of flow of shielding gas or mixture of shielding gas.
- (i) A change in the position in which welding is done as defined in Fig. XI-1520-1.
- (j) A change in the type of groove, e.g., a change from a single-Vee groove to a double-Vee groove.
- (k) A change in the shape of any one type groove involving the following:
 - (1) a decrease in the included angle of the groove exceeding 5 deg.;
 - (2) a decrease in the root opening of a groove exceeding $\frac{1}{16}$ in. (1.6 mm);
 - (3) an increase in the root face of a groove exceeding $\frac{1}{16}$ in. (1.6 mm);
 - (4) the omission, but not inclusion, of backing material.

(l) A decrease of more than 10% in the preheat or interpass temperature specified in the welding procedure, provided the resulting preheat or interpass temperature is not less than that specified in Table XI-1430-1.

(m) A change in the type of welding current (ac or dc), polarity, or mode of metal transfer across the arc.

(n) A change from uncoated to galvanized reinforcing bar.

(o) An increase of more than one bar size.

(p) An increase in the carbon equivalent number calculated by XI-1430.

XI-1530 WELD SPECIMEN TESTING

XI-1531 Purpose of Test

The tests listed below are to determine the tensile strength and degree of soundness of welded joints made under a given procedure specification:

(a) full-section tension test (for tensile strength)

(b) macroetch test (for soundness)

XI-1532 Base Metal

The base metal and its preparation for welding shall comply with the Welding Procedure Specification.

XI-1533 Direct Butt Splices

All direct butt splices shall be classified in accordance with definitions of welding positions for groove welds

Page 208

and shall be welded in the position for which the procedure is to be qualified (see Fig. XI-1420-1).

FIG. XI-1520-1 DIRECT BUTT SPLICE TEST POSITIONS FOR GROOVE WELDS

FIG. XI-1520-1 DIRECT BUTT SPLICE TEST POSITIONS FOR GROOVE WELDS

GENERAL NOTES:

- (a) For bars No. 9 or larger, use single Vee- or bevel groove weld ($\theta = 45$ deg.).
- (b) For bars No. 8 or smaller, use single Vee-groove with split pipe backing ($\theta = 60$ deg.).

FIG. XI-1530-1 COMPLETE JOINT PENETRATION GROOVE

FIG. XI-1530-1 COMPLETE JOINT PENETRATION GROOVE

XI-1534 Test Welds

Three test welds shall be made for each procedure specification to be qualified. Unless a greater length is required by the testing agency, the test weld specimens for direct butt splices shall have a minimum length of at least 16 times the diameter of the bar with the weld centrally located (see Fig. XI-1530-1). Two of the three test welds shall be subject to a full-section tensile test. The remaining test weld shall be subjected to the macroetch test.

XI-1535 Method of Testing Specimens

(a) *Full-Section Tensile Test.* The test joints shall be tensile tested in the as-welded condition, i.e., full-size welded joints without machining. The minimum distance between jaws of the testing machine shall be equal to at least eight times the diameter of the bar for direct butt splices. The test specimens shall be ruptured under tensile load. The maximum load, lb, shall be determined. The tensile strength, psi, shall be obtained by dividing the maximum load by the nominal cross-sectional area of the bar.

(b) *Macroetch Test.* The test specimens shall be mechanically cut perpendicular to the direction of welding. The section so obtained shall be polished and show the full longitudinal cross section of the weldment, the root of the weld, and any reinforcement. Etching shall be done by a suitable solution to give a clear definition of the weld.

XI-1536 Test Results Required

(a) *Full-Section Tension Test.* The tensile test results shall comply with the strength requirements of Table CB-4334-1 or Table CC-4334-1, as applicable, for the appropriate grade of reinforcing bar.

(b) *Macroetch Test.* The specimens shall be examined for imperfections and shall comply with the acceptance standards of XI-1622. The etched cross section shall show complete penetration and complete fusion with the base metal.

XI-1540 WELDER AND WELDING OPERATOR PERFORMANCE QUALIFICATION

The requirements for the initial qualification test for welders and welding operators shall be in accordance with XI-1541.

Welders and welding operators shall qualify for each type of weld to be performed by that individual during the course of the work. The completed qualification welds that are tension tested shall satisfy the tensile requirements specified in Table CB-4334-1 or Table CC-4334-1, as applicable.

Page 210

XI-1541 Limitation of Variables

Qualifications established with any of the reinforcing steels shall be considered as qualification to weld any of the other reinforcing steels within the essential variables. Separate qualifications, without reciprocal validity, shall be required for galvanized and uncoated steels. A welder or welding operator shall be qualified for each process to be used in production. A welder or welding operator qualified with an approved electrode and shielding medium combination shall be considered qualified to weld with any other approved electrode and shielding medium combination (see Table XI-1410-1) for the process used in the qualification test. A change in the position of welding to a position for which the welder is not already qualified shall require requalification of the welder or welding operator.

XI-1542 Qualification Tests Required

The qualification test joint shall be a full penetration groove weld made by the SMAW, GMAW, or FCAW process with a single-Vee groove or bevel groove (see Fig. XI-1530-1). Welding on No. 9 bar shall qualify a welder or welding operator for welding all bars greater than No. 9 within the essential variables. If bars smaller than No. 9 are to be welded, the welder or welding operator shall qualify on the smallest bar size to be welded. For bars smaller than No. 9, split pipe backing shall be used (see Fig. XI-1420-1).

XI-1543 Position of Test Welds and Validity of Qualification for Direct Butt Splice Groove Weld Tests

(See Fig. XI-1520-1)

- (a) Qualification in the 1G (flat) position qualifies for welding in the 1G position only.
- (b) Qualification in the 2G (horizontal) position qualifies for welding in the 1G and 2G positions.
- (c) Qualification in the 3G (vertical) position qualifies for welding in the 1G, 2G, and 3G positions.
- (d) Qualification in the 4G (overhead) position qualifies for direct butt welding in the 1G and 4G positions.
- (e) Qualification in the 1G and 2G positions qualifies for welding in the 1G position for diagonal bars.
- (f) Qualification in the 2G and 3G positions qualifies for welding in the 3G position for diagonal bars.

XI-1544 Base Metal

The base metal used shall comply with CB-2310 or CC-2310, as applicable.

XI-1545 Welding Procedure

The welder or the welding operator shall follow the Welding Procedure Specification.

XI-1546 Test Specimens - Number, Type, and Preparation

For each test there shall be two test assemblies welded in accordance with XI-1540 to qualify each welder or welding operator.

Test assemblies welded by GMAW (except short circuiting transfer), SMAW, or FCAW shall be tested by radiography, or one test assembly shall be subjected to the full-section tensile test and the other test assembly to the macroetch test. Direct butt splice test assemblies welded by GMAW short-circuiting transfer methods shall have one test assembly subjected to the full-section tension test and the other to the macroetch test.

Unless a greater length is required by the testing agency, the full-section tension test specimens shall have a minimum length of at least 16 times the diameter of the bar with the weld centrally located (see Fig. XI-1530-1).

XI-1547 Method of Testing Specimens

(a) *Full-Section Tension Test.* The test joints shall be tensile tested in the as-welded condition, i.e., full-size welded joints without machining. The minimum distance between jaws of the testing machine shall be equal to at least eight times the diameter of the bar for direct butt splices. The test specimens shall be ruptured under tensile load. The maximum load, lb, shall be determined. The tensile strength, psi, shall be obtained by dividing the maximum load by the nominal cross-sectional area of the bar.

(b) *Macroetch Test.* The test specimens shall be mechanically cut perpendicular to the direction of welding. The section so obtained shall be polished and show the full longitudinal cross section of the weldment, the root of the weld, and any reinforcement. Etching shall be done by a suitable solution to give a clear definition of the weld.

XI-1548 Test Results Required

(a) *Radiographic Examination.* For acceptable qualification, the weld shall meet the acceptance standards of XI-1622.

(b) *Full-Section Tension Test.* The tension test results shall comply with the strength requirements of Table CB-4334-1

Page 211

or Table CC-4334-1, as applicable, for the appropriate grade of reinforcing bar.

(c) *Macroetch Test.* The specimens shall be examined for imperfections and shall meet the acceptance standards of XI-1622. The etched cross section shall show complete penetration and complete fusion with the base metal.

XI-1549 Retests

If a welder or welding operator fails to meet the qualification requirements of one or more test welds, a retest may be allowed under the following conditions.

(a) An immediate retest may be made consisting of two test welds of each type on which the welder or welding operator failed. All test specimens shall meet all requirements for all such welds.

(b) A retest may be made provided there is evidence that the welder or welding operator has had further training or practice. A complete retest shall be made in this case.

(c) If the Inspector has reason to doubt the qualifications of a welder or welding operator, he may require retest.

XI-1550 PERIOD OF EFFECTIVENESS

The welder's or welding operator's qualifications specified in this Code shall remain in effect indefinitely unless:

(a) the welder or welding operator is not engaged in a given process of welding for which he is qualified for a period exceeding 6 months;

(b) there is some specific reason to question a welder's or welding operator's ability.

XI-1551 Records

Records of the test results shall be kept by the Constructor or Fabricator and shall be available to those authorized to examine them.

XI-1560 CONTINUING JOINT PERFORMANCE TESTS

XI-1561 Introduction

A continuing series of tests shall be made to ensure joints meet the tensile requirements. Nondestructive examination requirements are specified in XI-1600.

XI-1562 Joint Samples

Joint samples may be production joints (i.e., cut directly from in-place reinforcement) or sister joints (i.e., removable joints made in place next to production joints and under the same conditions).

XI-1563 Testing Frequency

Separate test cycles shall be established for joints in horizontal, vertical, and diagonal bars as follows.

XI-1563.1 Production Joints.

If only production joints are tested, the sample frequency shall be as follows:

- (a) 1 of the first 10;
- (b) 1 of the next 90;
- (c) 2 of the next and each subsequent unit of 100.

XI-1563.2 Production and Sister Joints.

If production and sister joints are tested, the sample frequency shall be as follows:

- (a) 1 production joint of the first 10 production joints;
- (b) 1 production and 3 sister joints for the next 90 production joints;
- (c) 1 joint, either production or sister joint, for all subsequent units of 33 joints.

At least one-fourth of the total number of joints tested shall be production joints.

XI-1563.3 Sister Joints.

Straight sister joints shall be substituted for production samples or radius bent bars and for bars arc welded to structural steel elements or the liner.

XI-1564 Tensile Testing Requirements

Joint samples shall be tensile tested using the loading rates set forth in SA-370. The following shall constitute the acceptance standards.

- (a) The tensile strength of each sample shall equal or exceed 125% of the specified yield strength as shown in Table CB-4334-1 or Table CC-4334-1, as applicable.
- (b) The average tensile strength of each group of 15 consecutive samples shall equal or exceed the specified minimum tensile strength as shown in Table CB-4334-1 or Table CC-4334-1, as applicable.
- (c) If any sample joint tested fails to meet the provisions of (a) or (b) above, requirements of XI-1565 shall be followed.

Page 212

XI-1565 Substandard Tensile Test Results

(a) If any production or sister joint used for testing fails to meet the strength requirement of Table CB-4334-1 or Table CC-4334-1, as applicable, and failure occurs in the bar, the cause of the bar break shall be investigated by the Constructor or Fabricator. Any necessary corrective action affecting joint samples shall be implemented prior to continuing the testing frequency of XI-1563.

(b) If any production joint used for testing fails to meet the strength requirement of Table CB-4334-1 or Table CC-4334-1, as applicable, and failure does not occur in the bar, the adjacent production joints on each side of the failed joint shall be tested. If any sister joint used for testing fails to meet the strength requirement of Table CB-4334-1 or Table CC-4334-1, as applicable, and failure does not occur in the bar, two additional sister joints shall be tested. If either of these joints fails to meet the strength requirement of Table CB-4334-1 or Table CC-4334-1, as applicable, welding shall be halted. Welding shall not be resumed until the cause of failures has been corrected.

(c) If the running average tensile strength of 15 consecutive joints fails to meet the strength requirement of Table CB-4334-1 or Table CC-4334-1, as applicable, welding shall be halted. The Constructor or Fabricator shall investigate the cause and make the necessary corrective action.

(d) When welding is resumed, the testing frequency shall be started anew.

XI-1570 RECORDING OF TENSILE TEST RESULTS

The results of all tensile tests obtained from the tests prescribed by XI-1530, XI-1540, and XI-1560, along with all other pertinent data, shall be recorded.

XI-1600 EXAMINATION OF WELDED JOINTS OF REINFORCING BAR

XI-1610 VISUAL EXAMINATION

All completed arc welded joints shall be visually examined for the presence of cracks, undercut, inadequate size, and other visible defects. Welds exhibiting such defects shall be repaired.

**TABLE XI-1620-1
RADIOGRAPH ACCEPTANCE CRITERIA**

Bar Size	Sum of Discontinuity Dimensions, in.	Single Discontinuity Dimension, in.
8	$\frac{3}{16}$	$\frac{1}{8}$
9	$\frac{3}{16}$	$\frac{1}{8}$
10	$\frac{1}{4}$	$\frac{1}{8}$
11	$\frac{1}{4}$	$\frac{3}{16}$
14	$\frac{5}{16}$	$\frac{3}{16}$
18	$\frac{7}{16}$	$\frac{1}{4}$

TABLE XI-1620-1 RADIOGRAPH ACCEPTANCE CRITERIA

XI-1620 RADIOGRAPHIC EXAMINATION

XI-1621 Extent and Procedure Requirements

One joint selected at random from each 25 direct butt production joints made by each welder shall be radiographed from two mutually perpendicular directions. The radiographic examination procedure shall be in accordance with Article 2 of Section V. Ultrasonic examination and inspection may be performed where radiographic examinations are not practical. If ultrasonic examination is used, the examination shall be in accordance with Article 5 of Section V.

XI-1622 Acceptance Standards

Welds shall be free of any type of crack or zone of incomplete fusion or penetration. All craters shall be filled to the full cross section of the weld.

Direct butt splices inspected by radiography shall have a maximum dimension of any single porosity or fusion type discontinuity or the sum of the maximum dimensions of all porosity or fusion type discontinuities not exceeding the limits given in Table XI-1620-1.

Undercutting deeper than $\frac{1}{32}$ in. (0.8 mm) shall not be allowed, regardless of the direction of stress, except that at points where welds intersect the raised pattern of deformations, undercutting less than $\frac{1}{16}$ in. (1.6 mm) deep shall be acceptable. Welds shall be free of all overlaps.

Welds that are shown by radiography to have any of the following types of discontinuities are unacceptable:

- (a) any zone of incomplete fusion, crack, or lack of penetration;
- (b) any other indication which is greater than the limits of Table XI-1620-1.

Page 213

XI-1623 Reexamination

(a) If any of the welded joints are found unacceptable, they shall be replaced and reexamined. Two additional joints from the same group, preferably one on either side of the unacceptable joint, shall also be subject to radiographic examination. If these joints meet the acceptance criteria, all of the remaining joints out of that group of 25 shall be considered acceptable, subject to continuous requalification tests.

(b) If any of the additional joints do not meet the acceptance criteria, all remaining joints of that group shall be reexamined and any unacceptable joints shall be rejected. The operator shall then be requalified in accordance with XI-1540.

APPENDIX C TYPICAL CRV LOAD COMBINATIONS (OPTIONAL)

Page 215

ARTICLE C-1000 TYPICAL LOAD COMBINATIONS

A typical CRV load combination example is presented in this Appendix. The notation used is that of Appendix III.

Construction

$$D_{we} + L_c + F_i$$
$$D_{weir} + L_c + F_i + P_i + T_t$$

Normal

$$D_{weir} + L_m + F_t + T_o$$
$$D_{weir} + L_m + F_t + T_o + P_o$$
$$D_{weir} + L_m + F_t + T_o + P_v$$

Abnormal

$$D_{weir} + L_m + F_t + T_o + P_m$$

$$D_{weir} + L_m + F_t + T_a + P_o$$

Severe Environmental

$$D_{weir} + L_m + F_t + T_o + P_o + E_o$$

$$D_{weir} + L_m + F_t + T_o + E_o$$

Extreme Environmental

$$D_{weir} + L_m + F_t + T_o + P_o + E_{ss}$$

$$D_{weir} + L_m + F_t + T_o + E_{ss}$$

$$D_{weir} + L_m + F_t + T_a + P_o$$

Failure

$$D_{wir} + L_m + F_t + P_{mc}$$

$$D_{wir} + L_m + F_t + T_m$$

$$D_{weir} + L_m + F_t + T_o + Y_{jr}$$

$$D_{weir} + L_m + F_t + T_o + P_m + E_{ss}$$

$$D_{weir} + L_m + F_t + Y_{jr} + E_{ss}$$

$$D_{weir} + L_m + 0.5F_t + P_o + T_o$$

NOTE: In the above notation, multiple subscripts on D and Y indicate a combination of the loads represented by all subscripts: for example, D_{we} represents D_w plus D_e .

APPENDIX D NONMANDATORY PREHEAT PROCEDURES

Page 221

ARTICLE D-1000 NONMANDATORY PREHEAT PROCEDURES

D-1100 INTRODUCTION

D-1110 SCOPE

The preheat temperatures given herein are a general guide for the materials listed in P-Numbers of Section IX. Specific rules for preheating are not given, and the minimum preheating temperatures suggested are not mandatory. The Welding Procedure Specification for the material being welded shall specify the minimum preheating requirements under the welding procedure qualification requirements of Section IX.¹

D-1120 TEMPERATURE MAINTENANCE

(a) Difficulty may be experienced with certain materials if the temperature is allowed to fall below the preheat temperature between passes. It may be desirable to maintain the preheat temperature or to heat the joint to the postweld treatment temperature before allowing it to cool to ambient temperature.

¹ These requirements do not apply to the arc welding of reinforcing bar, the requirements for which are given in XI-1560.

(b) The preheat temperature may be checked by suitable methods, such as temperature-indicating crayons or thermocouple pyrometers, to ensure that the required preheat temperature is maintained during the welding operation. The Fabricator or Constructor should be cautious in the use of temperature-indicating crayons and pellets because some metals may be severely attacked by the chemicals in crayons or pellets at elevated temperatures.

D-1200 FERROUS MATERIAL

D-1210 PREHEAT TEMPERATURES

D-1211 Group P-No. 1

A temperature of 175°F (79°C) is suggested for material which has both a specified maximum carbon content in excess of 0.30% and a thickness in excess of 1 in. (25 mm) This does not apply to fillet welds $\frac{1}{2}$ in. (13 mm) and under in size that are used to attach parts not carrying loadings due to internal pressure. For all other material in this group, 50°F (10°C) is suggested.

It is suggested that stud welding be performed at not less than 0°F (-18°C).² When the ambient temperature is less than 32°F (0°C), it is suggested that the stud welding procedure be tested at the start of each day's production welding period. Testing shall be done by bend testing of two studs to an angle of 15 deg. and returning to their original position.

D-1212 Group P-No. 8

No preheat temperatures are suggested.

² This temperature (0°F) does not mean the ambient environmental temperature but the temperature in the immediate vicinity of the weld. The ambient environmental temperature may be below 0°F, but a heated structure or shelter around the area being welded could maintain the temperature adjacent to the weldment at 0°F or higher.

APPENDIX E CERTIFICATION OF LEVEL I AND II CONCRETE INSPECTION PERSONNEL

Page 223

ARTICLE E-1000 INTRODUCTION

E-1100 OBJECTIVE OF CERTIFICATION PROGRAM

The objective of this Appendix is to provide a guide for use by Constructors and Fabricators in the training, evaluation, and certification of Level I and II concrete inspection personnel. Uniformity of duties, training, and evaluation is helpful in facilitating review by the Owner, Authorized Inspectors, regulatory agencies, or independent groups. The contents of this Appendix constitute recommendations and are nonmandatory. The certification program for concrete inspection and testing personnel is designed to provide assurance that personnel have the appropriate technical knowledge, skill, and experience to properly perform the required tests and inspections. Appendix VII presents the Code requirements for qualifications of concrete inspection personnel.

E-1200 ORGANIZATION

The total program includes the following:

- (a) description of duties and responsibilities of concrete inspection and testing personnel;
- (b) determination of the knowledge and skill requirements to perform the duties assigned;

- (c) formulation of the classroom training program and the on-the-job training program;
- (d) provision of a method of verifying that a person has the knowledge and skill to properly perform concrete inspection operations;
- (e) certification of concrete inspection and testing personnel.

E-1300 IMPLEMENTATION

The Constructor or Fabricator has the responsibility for the qualification and certification of concrete inspection and testing personnel. The work of establishing training practices and certification procedures, and providing the resources in terms of personnel, equipment, and services necessary to implement the program may be delegated to other organizations. These inspection personnel are certified as Levels I, II, and III in ascending order of responsibility. The qualification and certification of the Level I and II concrete inspection personnel are under the supervision and control of the Level III Concrete Inspector. The Level III Concrete Inspector has the following duties with regard to certification of Level I and II concrete inspection personnel:

- (a) development of training programs;
- (b) development of evaluation programs;
- (c) preparing and giving examinations;
- (d) certification of concrete inspection and testing personnel.

The Constructor or Fabricator shall conduct a training program, examine his personnel, and certify their qualifications to perform tests and inspections or, alternatively, he may have his personnel trained by others in a school or by taking courses of training; however, the responsibility for certification shall rest with the Constructor or Fabricator and shall be performed by a certified Level III Concrete Inspector who may be his employee or an employee of an outside organization under contract to the Constructor or Fabricator, as applicable.

ARTICLE E-2000 LEVEL I CONCRETE INSPECTION TECHNICIAN

E-2100 GENERAL

A Level I Concrete Inspection Technician should have experience in and shall have satisfactorily completed appropriate training and passed an examination in concrete inspection and testing. He should be familiar with test equipment to be used and should be able to

Page 224

demonstrate proficiency in the use of this equipment. Appendix VII presents the Code requirements for education, experience, and work functions assigned to Level I Concrete Inspection Technicians.

E-2200 ASSIGNMENT AND DESCRIPTION OF DUTIES

The assignment of duties is the responsibility of the Constructor or Fabricator as different organizations and construction projects will require various combinations of functions. It is important that the classroom and on-the-job training, evaluation, and certification match the duties assigned.

E-2210 DESCRIPTIONS OF DUTIES

Two basic Level I descriptions are developed: one for a Reinforcing Material Technician, and the other for a Concrete Material Technician.

E-2211 Reinforcing Material Technician

- (a) Performs receiving and storage inspection of metallic materials used in concrete construction. These include reinforcing steel, embedments, mechanical splice kits, post-tensioning embeds, post-tensioning anchorage components, metallic parts, welding materials, and liner plate materials.

(b) Inspects the installation of mechanical splices, including void determinations, torque values, or other specified criteria.

(c) Performs tensile and bend testing of reinforcing steel.

(d) Performs tensile testing of mechanical splices.

(e) Prepares reports that give the results of the above inspections and tests.

E-2212 Concrete Material Technician

(a) Performs receiving and storage inspection of materials used in the production of concrete. These include materials such as cement, admixtures, and aggregates.

(b) Conducts routine field tests on fresh concrete, such as slump, air content, unit weight, temperature, and preparation of test cylinders.

(c) Inspects finishing, curing, and patching.

(d) Conducts routine jobsite laboratory tests, such as gradation, moisture content, and compressive strength.

(e) Prepares reports that give the results of the above inspections and tests.

ARTICLE E-3000 LEVEL II CONCRETE INSPECTOR

E-3100 GENERAL

A Level II Concrete Inspector should have experience in and shall have satisfactorily completed appropriate training and passed an examination in concrete inspection and testing and in the review and evaluation of the results of the inspection and tests. He shall be capable of supervising or maintaining surveillance over the inspections and tests performed by others and of calibrating or establishing the validity of calibration of testing equipment. He shall have demonstrated proficiency in planning and setting up tests and shall be capable of determining the validity of test results. A Level II Concrete Inspector may also function as a Level I Concrete Inspection Technician in areas in which he is qualified. Appendix VII presents the Code requirements for education, experience, and work functions assigned to Level II Concrete Inspectors.

E-3200 DESCRIPTION OF DUTIES

The duties of the Level II Concrete Inspector involve inspections and tests that are more complex than those performed by a Level I Concrete Inspector. He is required to evaluate and interpret specifications, codes, procedures, documents, tests, and inspection reports. His supervisory duties for Level I personnel include analysis, review, and approval of the reports prepared by Level I Concrete Inspection Technicians.

E-3210 DESCRIPTIONS OF DUTIES

Descriptions of four Level II Concrete Inspectors have been developed and follow. The two basic descriptions suggested are a Preplacement Inspector and a Batching and Placement Inspector. The two specialty descriptions suggested are a Prestressing Systems Inspector and a Laboratory Tester.

E-3211 Preplacement Inspector

(a) Inspects the placement of reinforcing steel, embedments, prestressing bearing plates, tendon ducts, and trumpets for precast and cast-in-place concrete.

(b) Inspects construction joints, water stops, and form work for precast and cast-in-place concrete.

(c) Prepares and interprets reports.

(d) Supervises Level I Reinforcing Material Technician.

E-3212 Batching and Placement Inspector

- (a) Inspects off-site or on-site batching plants.
- (b) Inspects concrete placing equipment, concrete placement, and consolidation for precast and cast-in-place concrete.
- (c) Inspects structural repairs of concrete.
- (d) Prepares and interprets reports.
- (e) Supervises Level I Concrete Material Technician.

E-3213 Prestressing Systems Inspector

- (a) Inspects such activities as insertion, stressing, anchoring, and greasing of prestressing systems.
- (b) Prepares and interprets reports.

E-3214 Laboratory Tester

- (a) Conducts specialized physical laboratory tests, such as shrinkage, creep, and trial batches for concrete, and physical tests for cement.
- (b) Prepares and interprets reports.

ARTICLE E-4000 TRAINING

E-4100 GENERAL

The requirements for Level I and II concrete inspection and testing personnel include a training course covering job related duties. The classroom training providing the facts and knowledge needed for the job should be supplemented by an on-the-job training program to perfect the practical skills necessary to do the work.

E-4110 CLASSROOM TRAINING

Lecture courses should describe the total quality assurance organization and the way each functional organization, i.e., engineering, purchasing, management, works in the implementation of the program. Inspection and testing personnel should be trained in nonconformance reporting, document control, general calibration, and related quality procedures. In addition, the Code requirements applying to their duties should be covered. The duties of the Authorized Inspector and his relationship with concrete inspection personnel should be included in the training course.

E-4200 SUGGESTED CLASSROOM TRAINING COURSES

The training should correspond to the duties assigned to testing and inspection personnel. On the basis of the illustrated Level I and Level II descriptions, suggested classroom hours are shown as indicated below. These hours are based upon typical training times and classes and may be modified to cover class content and needs of their specific assignment. The following classroom training courses are suggested.

E-4210 LEVEL I REINFORCING MATERIAL TECHNICIAN (10 TO 20 hr OF INSTRUCTION)

E-4211 Introduction

- (a) Experience in the use of concrete in nuclear power plants
- (b) Quality requirements for concrete used in reactors and containments
- (c) Basic inspection required for concrete
- (d) Relationships of jurisdictional authorities, Owner, Designer, Constructor, Fabricator, and regulatory agencies

E-4212 Shipping, Receiving, and Storage of Metallic Materials

- (a) Certified Material Test Reports/Certificate of Compliance
- (b) Identification and tagging
- (c) Shipping damage
- (d) Documentation
- (e) Inspection requirements
- (f) Storage requirements
- (g) In-process tests
- (h) Nonconformance procedures

E-4213 Inspection of Mechanical Splices

- (a) Cleanliness of the prepared ends
- (b) Centering
- (c) Assembly of splices
- (d) Inspection of completed splice assembly
- (e) Tension tests of splices as required

E-4214 Arc Welding of Reinforcing Steel

A training course on visual inspection of welding and control of weld filler materials should be provided where welding of reinforcing steel is specified.

Page 226

E-4215 Reports

- (a) Receiving inspection reports
- (b) Splice assembly reports
- (c) Tensile test reporting
- (d) Checklists or quality assurance reports

E-4220 LEVEL I CONCRETE MATERIAL TECHNICIAN (20 TO 40 hr OF INSTRUCTION)

E-4221 Introduction

- (a) Experience in the use of concrete in nuclear power plants
- (b) Quality requirements for concrete used in reactors and containments
- (c) Basic inspection required for concrete
- (d) Relationships of jurisdictional authority, Owner, Designer, Constructor, Fabricator, and regulatory agencies

E-4222 Shipping, Receiving, and Storage of Concrete Materials

- (a) Certified Material Test Reports

- (b) Identification and tagging
- (c) Shipping damage
- (d) Documentation
- (e) Inspection requirements
- (f) Storage requirements
- (g) In-process tests
- (h) Nonconformance procedures

E-4223 Field Tests on Fresh Concrete

- (a) Sampling
- (b) Slump test
- (c) Entrained air
- (d) Unit weight
- (e) Preparation, handling, and storage of concrete cylinders
- (f) Temperature

E-4224 Laboratory Tests

- (a) Sampling
- (b) Sieve analysis
- (c) Moisture content
- (d) Deleterious substances
- (e) Specific gravity
- (f) Compressive strength and curing of concrete cylinders
- (g) Reinforcing steel tensile tests (may also be a Reinforcing Material Technician function)

E-4225 Post-Placement

- (a) Finishing
- (b) Patching
- (c) Curing

E-4226 Reports

- (a) Receiving inspection reports
- (b) Fresh concrete reports
- (c) Laboratory reports
- (d) Post-placement reports
- (e) Checklists or quality assurance reports

E-4230 LEVEL II BATCHING AND PLACEMENT INSPECTOR

(20 TO 40 hr OF INSTRUCTION)

E-4231 Introduction

- (a) Code requirements for concrete, Construction Specifications, and the Construction Report
- (b) Basic inspection plans, procedures, and checklists
- (c) The Authorized Inspection Agency and the duties of the Authorized Inspector
- (d) Coordination of the inspection with the Authorized Inspector

E-4232 Concrete Batching

- (a) Moisture compensation and mix adjustment
- (b) Storing and conveying of materials
- (c) Batching and weighing of materials
- (d) Control of slump, air content, and temperature
- (e) Documentation

E-4233 Transportation and Placement of Concrete

- (a) Transportation equipment
- (b) Placement equipment
- (c) Concrete placement
- (d) Consolidation
- (e) Initial curing

E-4234 Structural Repairs of Concrete

- (a) Detection of areas to be repaired
- (b) Removal of unsatisfactory materials
- (c) Surface preparation

Page 227

- (d) Concrete placement and curing

E-4235 Supervision of Level I Personnel

- (a) Concrete Material Technician duties
- (b) Documentation and report review
- (c) On-the-job training

E-4236 Reports

- (a) Checklists or quality assurance reports
- (b) Batch plant weigh quantity tickets

E-4240 LEVEL II PREPLACEMENT INSPECTOR (10 TO 20 hr OF INSTRUCTION)

E-4241 Introduction

- (a) Code requirements for reinforcing systems, Construction Specifications, and the Construction Report
- (b) Basic inspection plans, procedures, and checklists
- (c) The Authorized Inspection Agency and the duties of the Authorized Inspectors
- (d) Coordination of the inspection with the Authorized Inspector

E-4242 Reinforcing Systems

- (a) Reinforcing steel, size, grade, spacing, and splice locations
- (b) Embedments
- (c) Prestressing systems bearing plates, trumpets, and tendon ducts

E-4243 Formwork

- (a) Alignment, dimensions, bracing, and shoring
- (b) Construction joints, water stops, and joint details
- (c) Cleanliness and form release

E-4244 Supervision of Level I Personnel

- (a) Reinforcing Material Technician duties
- (b) Documentation and report review
- (c) On-the-job training

E-4245 Reports

- (a) Checklists or quality assurance reports
- (b) Preplacement reports

E-4250 LEVEL II PRESTRESSING SYSTEMS INSPECTOR (20 TO 40 hr OF INSTRUCTION)

E-4251 Introduction

- (a) Code requirements for prestressing systems, Construction Specification, and the Construction Report
- (b) Basic inspection plans, procedures, and checklists
- (c) The Authorized Inspection Agency and the duties of the Authorized Inspector
- (d) Coordination of the inspection with the Authorized Inspector

E-4252 Prestressing Systems

- (a) Background and theory
- (b) Comparison of systems
- (c) Assemblies

E-4253 Field Operations and Inspection

- (a) Insertion
- (b) Assembling anchorage components
- (c) Stressing
- (d) Greasing
- (e) Corrosion protection
- (f) Grouting

E-4254 Documentation

- (a) Tendon cards and identification
- (b) Stress-strain recorders
- (c) Checklists or quality assurance reports
- (d) Friction-elongation

E-4260 LEVEL II LABORATORY TESTER (20 TO 60 hr OF INSTRUCTION)

E-4261 Introduction

- (a) Code requirements for concrete
- (b) The Authorized Inspection Agency and the duties of the Authorized Inspector
- (c) Audit responsibilities of the Constructor or Fabricator
- (d) Calibration, documentation, and traceability
- (e) Report preparation

The following is a partial list of tests that may be performed in the laboratory. Training should cover these tests to be performed.

Page 228

E-4262 Standard Test Method for Soundness of Aggregates by Use of Sodium Sulfate or Magnesium Sulfate ASTM C 88

- (a) Scope and apparatus
- (b) Sampling and preparation of samples
- (c) Procedure
- (d) Quantitative examination and report

E-4263 Standard Test Method for Resistance to Degradation of Small Size Coarse Aggregate by Abrasion and Impact in the Los Angeles Machine ASTM C 131

- (a) Scope and apparatus
- (b) Test sample and abrasive change
- (c) Procedure

(d) Calculation and report

**E-4264 Standard Test Method for Length Change of Hardened Cement Mortar and Concrete
ASTM C 157**

(a) Scope and apparatus

(b) Mixing and molding of specimens

(c) Curing and storage of specimens

(d) Measurement of specimens and report

**E-4265 Standard Test Method for Potential Alkali Reactivity of Cement-Aggregate
Combinations (Mortar-Bar Method)
ASTM C 227**

(a) Scope and apparatus

(b) Mixing and molding of specimens

(c) Storage and measurement of specimens

(d) Examination and calculations

(e) Repeatability, interpretation, and reports

**E-4266 Standard Test Method for Potential Reactivity of Aggregates (Chemical Method)
ASTM C 289**

(a) Scope and apparatus

(b) Selection and preparation of test samples

(c) Dissolved silica by gravimetric method

(d) Dissolved silica by photometric method

(e) Reduction of alkalinity

(f) Repeatability, interpretation, and reports

E-4267 Static Modulus of Elasticity and Poisson's Ratio

(a) scope and apparatus

(b) Procedure and precision

(c) Calculations and reports

E-4268 Laboratory Trial Batches

(a) Scope and apparatus

(b) Moisture control of aggregates

(c) Mixing and molding specimens

(d) Curing and storage of specimens

(e) Tests and reports

E-4269 Physical Tests of Cement

- (a) Fineness
- (b) Time of set
- (c) Air content
- (d) Strength
- (e) Soundness
- (f) Optional physical requirements

E-4270 Physical Tests of Fly Ash and Pozzolans

- (a) Fineness
- (b) Loss on ignition
- (c) Pozzolanic activity index
- (d) Drying shrinkage of mortar bar
- (e) Uniformity requirements
- (f) Reactivity with cement alkalies

E-4300 ON-THE-JOB TRAINING

An on-the-job or laboratory training program should be used to instruct personnel in the practical skills and knowledge necessary for the job. Personnel in a training status should only perform tests or inspections under the direct supervision of certified Level I or II inspection personnel who are present where the work is being performed. The certified person shall prepare and sign reports concerning tests and inspection performed by personnel in a training status. Actual length of on-the-job training for each candidate should be set by the Level III Concrete Inspector.

Page 229

ARTICLE E-5000 EVALUATION

E-5100 EVALUATION

Evaluation should include a written examination, performance demonstration (if applicable), review of education and experience, and periodic performance appraisal.

E-5200 EXAMINATION

The Code requires that all inspection personnel satisfactorily complete an examination prior to certification. Proof of the examination and test results should be maintained. The adequacy of the examination for Level I and II personnel is the responsibility of the certified Level III Concrete Inspector. It is recommended that the evaluation include general questions, specific questions, and (if applicable) a performance demonstration.

E-5210 GENERAL QUESTIONS

General questions should be taken from the classroom course work and should reflect knowledge of the applicable portions of the Code, ACI Standards, ASTM Standards, and typical construction practices. General questions cover the background knowledge necessary to understand the purpose and evaluation of tests and inspections.

E-5220 SPECIFIC QUESTIONS

Specific questions should be taken from the actual tests and inspections to be performed by Level I or II personnel in their work. This testing should be based upon operational and test procedures and should emphasize the knowledge needed to perform tests and inspections properly.

E-5230 PERFORMANCE DEMONSTRATIONS

A performance demonstration should be used (if applicable) to determine the ability to handle test equipment and to perform the required inspections. The objective of the demonstration is to assess the actual hands-on performance of tests or inspections. Performance may be evaluated in a simulated environment or on the jobsite. The demonstration should be scored by subdividing the detailed steps or components of the test and evaluating the applicant upon his performance of each step. A typical test or inspection can generally be subdivided into at least ten detailed steps for scoring.

E-5300 SCOPE OF THE EVALUATION

It is the responsibility of the Level III Concrete Inspector to select questions and prepare the examination. He shall administer and conduct the examination and the performance demonstration. The scoring and length of examination will be dependent upon the extent of the duties and the responsibilities to be assigned. For Level I examinations, it is suggested that the breakdown be approximately 20% for general questions, 30% for specific questions, and 50% for the performance demonstration. For Level II, the percent given for the performance demonstration might be reduced and more weight given to general and specific questions. It is recommended that the percent given to the performance demonstration for any evaluation not exceed 50% of the total score. The overall pass-fail score line should be set at 70% with no individual score less than 60%.

A typical examination for the descriptions outlined in paragraphs E-2200 and E-3200 may have up to 40 multiple-choice closed-book general questions, up to 30 multiple-choice open-book specific questions, and 2 or more performance demonstrations. The general and specific portions of a typical examination might require up to 2 hr and the practical demonstration up to 2 hr.

E-5400 TYPICAL QUESTIONS

To illustrate a typical evaluation, four sample questions have been prepared for the Level I Concrete Material Technician.

E-5410 GENERAL QUESTIONS

E-5411 After cold weather protection is removed, the concrete should be:

- (a) allowed to cool rapidly;
- (b) protected from freezing;
- (c) allowed to cool gradually;
- (d) kept moist for 7 days.

Page 230

E-5412 Water curing, rather than other methods, is specified for mass concrete in warm weather because it can:

- (a) provide rapid curing;
- (b) prevent surface drying;
- (c) harden the surface;
- (d) aid in dissipating the heat of hydration.

E-5420 SPECIFIC QUESTIONS

E-5421 Using normal concrete mixes in weather above 40°F, concrete should be cured for a minimum of:

- (a) 5 days of membrane cure;

- (b) 7 days kept in a moist condition;
- (c) 4 days of water spray cure;
- (d) 14 days kept in a moist condition.

E-5422 In finishing a concrete slab, the floating and troweling operations should take place:

- (a) while water sheen is on the slab surface;
- (b) at least 7 hr after screeding operations;
- (c) when the slab is hard enough to withstand the kick of a man's foot with no apparent damage;
- (d) when water sheen disappears and the slab will support a man's foot with only a slight impression.

E-5430 PERFORMANCE DEMONSTRATION

- (a) Perform a unit weight test on fresh concrete in accordance with ASTM C 138.
- (b) Perform a slump test in accordance with ASTM C 143.

SEC III D2 NMA APP F

APPENDIX F LINER DIMENSIONAL TOLERANCES

Page 231

ARTICLE F-1000 LINER DIMENSIONAL TOLERANCES

F-1100 SCOPE

The dimensional tolerances as given herein are a general guide for constructed liners. These tolerances were established as typical for a liner with a diameter of 150 ft (45.7 m), a hemispherical dome, and a 150 ft (45.7 m) high cylindrical shell. Further consideration should be given to liners with different configurations or that vary significantly from these dimensions. Areas of the liner that visually appear to have significant deviations and do not fall on the check points suggested in this Appendix should also be examined.

F-1200 CYLINDRICAL LINERS

F-1210 GENERAL

The measurements are to be taken at the completion of the work on the circumferential seams above and below the point being measured and prior to supporting reinforcing bar or formwork on this section of the liner. Dimensional tolerances for right circular cylindrical liner shells are established in F-1220 and F-1230.

F-1220 OVERALL DIMENSIONS

(a) At the specified increments of elevation, the difference between the actual radius of the shell and the theoretical radius should not exceed the larger of 3 in. (76 mm) or $\frac{1}{3}$ of 1% of the radius. The radius shall be measured from the theoretical true vertical center line of the cylinder or some offset point. This requirement may be satisfied by measuring radii spaced approximately 30 deg. apart on each shell course. The vertical distance between these measurements should not exceed 12 ft (3.7 m). This requirement may be met by taking measurements within the center $\frac{1}{3}$ of the shell course height.

(b) The average elevation of points on the spring line of the cylinder measured at approximately 30 deg. apart should not

deviate from the theoretical elevation of the spring line of the cylinder by more than the larger of 3 in. (76 mm) or $\frac{1}{6}$ of 1% of the height. Also, these points should be enveloped by two horizontal planes which are no more than 1 in. (25 mm) apart.

(c) An individual liner plate should not deviate from vertical by more than 2 in. (51 mm) in 10 ft (3.0 m). This requirement may be satisfied by taking measurements approximately 30 deg. apart on each shell course. The vertical distance between these measurements should not exceed 12 ft (3.7 m).

F-1230 LOCAL DIMENSIONS

(a) The gap should be measured between the shell and a 15 ft (4.6 m) template curved to the theoretical radius when placed horizontally against the surface of the shell. Measurements may be made on the complete circumference at no greater than 12 ft (3.7 m) increments vertically. These requirements may be met by taking a set of measurements on each shell course. The gap should not exceed 1 in. (25 mm) with a single plate section when the template is not closer than 12 in. (305 mm) to a weld seam. When the template is closer than 12 in. (305 mm) to a weld seam or crosses a weld seam, the gap should not exceed $1\frac{1}{2}$ in. (38 mm). Measurements should be taken and recorded per Fig. F-1230-1.

(b) The gap between the liner shell and a straight edge placed vertically against the liner should not exceed 1 in. (25 mm). The length of the straight edge should be the height of the liner shell course minus 2 ft, and the measurement should not be taken across the weld seam. This requirement may be satisfied by taking measurements approximately 30 deg. apart on each shell course. Measurements should be taken and recorded per Fig. F-1230-1.

Page 232

F-1300 DOME LINERS

F-1310 GENERAL

The dimensional tolerances in this Subarticle are for the final dome configuration prior to supporting reinforcing bar or form work. It is recommended that the elevation and radial location of circumferential seams be checked during the erection so as to ensure that the final dome is within these tolerances.

F-1320 OVERALL DIMENSIONS

The difference between the actual location of the dome and the theoretical location should not exceed 6 in. The horizontal location of the dome should be measured relative to the center line of the top of the as-constructed cylindrical liner, and the vertical location of the dome should be measured relative to the average elevation of the top of the as-constructed cylindrical liner.

This requirement should be satisfied by taking measurements at 15 deg. intervals as shown in Fig. F-1320-1, Section. Measurement shall be taken at approximately 15 deg. in plan (see Fig. F-1320-1, Plan View) along these circles, except that the spacing need not be less than 15 ft (4.6 m).

F-1330 LOCAL DIMENSIONS

The gap should be measured between the shell and a 15 ft (4.6 m) template curved to the theoretical radius when placed normal to the shell (see Fig. F-1230-1). The gap should not exceed 1 in. (25 mm) within a single plate section when the template is not closer than 12 in. (305 mm) to a weld seam. When the template is closer than 12 in. (305 mm) to a weld seam or crosses a weld seam, the gap should not exceed $1\frac{1}{2}$ in. (38 mm). A minimum of one meridional and one horizontal template placement check should be made in each 225 sq ft (20.9 m²) of surface area. A suggested method of template placement is shown in Fig. F-1330-1. Measurements should be taken and recorded per Fig. F-1230-1.

When ground assemblies are used in construction, consideration may be given to taking these measurements on the ground after completion of the assembly, provided measurements are taken on the welds joining assemblies.

Page 233

Page 234

GENERAL NOTE:
Record measurements outside of tolerance or, if none are out of tolerance, record the maximum deviation per template placement.

SEC III D2 NMA APP G

APPENDIX G CERTIFIED MATERIAL TEST REPORTS FOR LINER MATERIALS

Page 237

ARTICLE G-1000 CERTIFIED MATERIAL TEST REPORTS FOR LINER MATERIALS

G-1100 INTRODUCTION

The requirements for a Certified Material Test Report (CMTR) are stated in NCA-3867.4(a). However, the material requirements vary with the class of construction, the product form of material, the requirements of the material specification, and the Manufacturer's procedures. Since changes in any of these requirements may be made by Addenda or new editions of the Code, it is important for the purchaser and the supplier to know the requirements of the applicable edition and Addenda, so that the reported results can be compared with the requirements to determine whether or not the material is in compliance with the Code.

G-1200 GENERAL REQUIRED INFORMATION

The following items of information are required in the CMTR's for material (as defined by CB/CC-2000) used in Section III, Division 2, Construction:

- (a) the Material Manufacturer's or the combination of the Material Manufacturer's and the Material Supplier's name, as applicable;
- (b) the Material Manufacturer's and the Material Supplier's Quality Systems Certificate (Materials) numbers and expiration dates, if the Manufacturer or supplier is a Certificate Holder;
- (c) purchaser's order or contract number;
- (d) description of the material, including specification number, grade, class, type, and nominal size, as applicable. For pipe made to specifications which include both seamless and welded pipe, the report shall designate which type it is.
- (e) description of material identification marking (NCA-3866.6);
- (f) results of chemical analyses, when required by the material specification;
- (g) results of tensile tests, when required by the material specification, including at least ultimate tensile strength and yield strength (or yield point);
- (h) reports of weld repairs performed, if any, as required by CB-2533.5.6, CB-2534.3, CB-2535.8, CC-2533.4.6, CC-2534.4, or CC-2537.8.6, including radiographic films when radiography is required;
- (i) Charpy V-notch (C_v) or drop weight test results required by CB/CC-2523 or CC-2524 when testing is required by CB/CC-2521. When Charpy V-notch impact tests are required, the report shall include the test temperature; the absorbed energy; the lateral expansion; the percent shear; and the location and orientation of specimens used. When drop weight tests are required, the report shall include the test temperature; the type, location, orientation of specimens used; and the results of the tests (break or no break).
- (j) nondestructive examinations performed and accepted as required by CB/CC-2530.

G-1300 INFORMATION REQUIRED UNDER SPECIFIC CIRCUMSTANCES

The following information is required under the specific circumstances given:

(a) heat treatment data as required by NCA-3867.4(a)(2):

(1) temperatures (or temperature ranges) and times at temperature used when the material specification requires specific temperatures and times;

(2) heat treatment conditions when no specific temperatures (or temperature ranges) or times are required by the material specification;

Page 238

(3) the minimum solution annealing temperature used for austenitic stainless steels and high nickel alloys, when required by the material specification;

(4) recorded temperature ranges and actual times at temperature, and heating and cooling rates for postweld heat treatment of materials that are repaired by welding, when postweld heat treatment is required by CB-2533.5.5 and CC-2533.4.5;

(5) recorded temperature ranges and actual times at temperature for postweld heat treatment of materials that are repaired by welding, when postweld heat treatment is required by CB-2534.3, CC-2534.4, and CC-2537.8.5;

(6) recorded temperatures and actual times at temperature for test coupons, when required by CB-2525 and CC-2526 (applicable only when those paragraphs are applicable);

(b) hydrostatic test pressure, when a hydrostatic test is required by the material specification, or notation that the hydrostatic test has not been performed, if it is deferred;

(c) Ferrite Number for all A-No. 8 welding material except type 16-8-2, as required by CB/CC-2613.3;

(d) When a fine grain size is specified for metallic materials, the grain size shall be reported in accordance with ASTM E 112

(e) other tests and test results as given in (1) and (2) below;

(1) results of other tests (such as hardness and cone stripping tests) which have quantitative results shall be included when such tests are required by the material specification;

(2) tests that have been performed and accepted to comply with a material specification shall be enumerated (such as bending, flattening, flaring, and flanging tests);

(f) for welding materials, in addition to the applicable paragraphs above, the process; preheat and interpass temperature; type of chemical analysis (filler metal/undiluted deposit); shielding gas composition; and Ferrite Number shall be reported as required by CB/CC-2600 and as applicable.

G-1400 EXECUTION

All requirements of the material specification and the Code need not be performed by the same organization. Therefore, reports may be executed by more than one organization, provided each organization is identified on the report for the item for which it is responsible.

APPENDIX H REINFORCEMENT FABRICATION AND PLACING TOLERANCES

Page 239

ARTICLE H-1000 REINFORCEMENT FABRICATION AND PLACING TOLERANCES

H-1100 SCOPE

The dimensional tolerances as given herein are a general guide for the fabrication and placing of reinforcement. These tolerances are established as guides and further considerations shall be given to the fabrication, placing of reinforcement, concrete placement, and formwork tolerances when determining the tolerance requirements for the Construction Specification.

H-1200 FABRICATION TOLERANCES

H-1210 GENERAL

The fabrication tolerances provided herein are industry standards. The designer shall give consideration to the configuration and location of the bars in the structure when developing fabrication tolerances in the Construction Specification.

H-1220 FABRICATION TOLERANCES FOR BAR SIZES #3 THROUGH #11

Bar sizes #3 through #11 shall be fabricated to meet the tolerances shown in Fig. H-1220-1 for the bend types shown.

H-1230 FABRICATION TOLERANCES FOR BAR SIZES #14 AND #18

Bar sizes #14 and #18 shall be fabricated to meet the tolerances shown in Fig. H-1230-1 for the bend types shown.

H-1300 PLACING TOLERANCES

H-1310 GENERAL

The placing of reinforcement shall be controlled to ensure that the requirements of the design are satisfied; the proper quantity of reinforcement shall be placed such that the design loads are resisted by properly developed reinforcement and concrete can be properly placed and consolidated. The requirements provided herein shall be considered guidelines. Special design requirements shall also be considered in developing the Construction Specification.

H-1320 LOCATION OF REINFORCEMENT

(a) Reinforcement shall be placed within a tolerance of plus or minus one-half the nominal rebar spacing shown on the design drawings, except as stated in (b) and (c) below. In any given run of bars (not to exceed section thickness in length), the total quantity of bars required by design shall be provided (see Fig. H-1320-1).

(b) The reduction of depth d shall not exceed $0.05d$ or 2 in.

(c) The clear distance between reinforcing steel and steel liner shall not be less than 2 in.

H-1330 SPACING

The acceptable spacing tolerances may vary depending on the size and configuration of the structure, the rebar pattern, and the largest size of aggregate to be used. Acceptable tolerances shall ensure proper placing and consolidation of concrete and take into account the design requirements in H-1320.

Page 240

Page 242

FIG. H-1220-1 STANDARD FABRICATING TOLERANCES FOR BAR SIZES #3 THROUGH #11

FIG. H-1220-1 STANDARD FABRICATING TOLERANCES FOR BAR SIZES #3 THROUGH #11

FIG. H-1220-1 (CONT'D)

GENERAL NOTES:

- (a) Entire shearing and bending tolerances are customarily absorbed in the extension past the last bend in a bent bar.
- (b) Angular Deviation—maximum $\pm 2\frac{1}{2}$ deg. or $\pm 1\frac{1}{2}$ in./ft on all 90 deg. hooks and bends. Saw cut both ends—overall length $\pm \frac{1}{2}$ in. All tolerances single plane and as shown.
- (c) Tolerances for Types S1–S9, T1–T9 apply to bar sizes #3–#5 inclusive only.
- (d) Tolerance Symbols
 - 1 = bar sizes #3, 4, 5 — $\pm \frac{1}{2}$ in. (gross length < 12 ft–0 in.)
 - = bar sizes #3, 4, 5 — ± 1 in. (gross length $\geq$ 12 ft–0 in.)
 - = bar sizes #6, 7, 8 — ± 1 in.
 - 2 = ± 1 in.
 - 3 = +0 in., $-\frac{1}{2}$ in.
 - 4 = $\pm \frac{1}{2}$ in.
 - 5 = diameter $\leq$ 30 in. $\pm \frac{1}{2}$ in.
 - = diameter < 30 in. ± 1 in.
 - 6 = $\pm 1.5\% \times 0$ dimension, ± 2 in. min.**

*Dimensions on this line are to be within tolerance shown but are not to differ from the opposite parallel dimension by more than $\frac{1}{2}$ in.

** If application of positive tolerance to Type 9 results in a chord length equal to or greater than the arc or bar length, the bar may be shipped straight.

SI UNITS

Page 253

The 1998 Edition of the Boiler and Pressure Vessel Code is based on U.S. Customary (ft-lb) units of measurement which are to be regarded as the standard. This supplement is provided as a convenience to the Code user and contains SI conversion factors for units contained in the Code.

Page 254

Page 255

LIST OF SI UNITS FOR USE WITH ASME BOILER AND PRESSURE VESSEL CODE¹

Quantity	Unit	Symbol	Other Units or Limitations
Space and Time			
plane angle	radian	rad	degree (decimalized)
length	meter	m	
area	square meter	m ²	
volume	cubic meter	m ³	liter (L) for liquid only (use without prefix other than in milliliter, mL)
time	second	s	minute (min), hour (h), day (d), week, and year
Periodic and Related Phenomena			
frequency	hertz	Hz	revolutions per second (r/s)
rotational frequency	revolutions per second	s ⁻¹	revolutions per minute (r/m)
Mechanics			
mass	kilogram	kg	
density	kilogram per cubic meter	kg/m ³	
moment of inertia	kilogram · meter ²	kg · m ²	
force	newton	N	
moment of force (torque)	newton-meter	N · m	
pressure and stress	pascal	Pa	(pascal = newton per square meter)
energy, work	joule	J	kilowatt-hour (kW · h)
power	watt	W	
impact strength	joule	J	
section modulus	meter ³	m ³	
moment of section (second moment of area)	meter ⁴	m ⁴	
fracture toughness	Pa · $\sqrt{m}$		
Heat			
temperature — thermodynamic [Note (2)]	kelvin	K	degree Celsius (°C)
temperature — other than thermodynamic	degree Celsius	°C	kelvin (K)
linear expansion coefficient	meter per meter-kelvin	K ⁻¹	°C ⁻¹
quantity of heat	joule	J	
heat flow rate	watt	W	
thermal conductivity	watt per meter-kelvin	W/(m · K)	W/(m · °C)
thermal diffusivity	square meter per second	m ² /s	
specific heat capacity	joule per kilogram-kelvin	J/(kg · K)	J/(kg · °C)
Electricity and Magnetism			
electric current	ampere	A	
electric potential	volt	V	
current density	ampere per meter ²	A/m ²	
magnetic field strength	ampere per meter	A/m	

NOTES:

- (1) Conversion factors between SI units and U.S. customary are given in SI-1, "ASME Orientation and Guide for Use of SI (Metric) Units," and ASTM E 380.
- (2) Preferred use for temperature and temperature interval is degrees Celsius (°C), except for thermodynamic and cryogenic work where kelvins may be more suitable. For temperature interval, 1 K = 1°C exactly.

NOTES:

- (1) Care should be taken when converting formulas or equations that contain constant terms or factors. The value of these terms must be understood and may also require conversion.
- (2)(a) Relationships that are exact in terms of the base units are followed by a single asterisk.
- (b) The factors are written as a number greater than 1 and less than 10 with 6 or fewer decimal places. The number is followed by the letter E (for exponent), a plus or minus symbol, and two digits which indicate the power of 10 by which the number must be multiplied to obtain the correct value. For example: 3.523 907 E-02 is $3.523\ 907 \times 10^{-2}$ or 0.035 239 07.

**IMPORTANT INFORMATION ON THE 1998 BOILER AND PRESSURE VESSEL CODE
ADDENDA DISTRIBUTION SCHEDULE**

There is a change in the way the Addenda to the 1998 Edition of the ASME Boiler and Pressure Vessel Code are distributed. The 1998 Edition, published July 1, 1998, incorporates the 1998 Addenda revisions, additions, or deletions. There will be no separate 1998 Addenda issued in a replacement page format. Two additional Addenda to the 1998 Edition, in the form of replacement pages, will be issued on July 1, 1999 and July 1, 2000.

The Summary of Changes published with the 1998 Edition lists and describes the revisions that are part of the 1998 Addenda. These changes are identified with a margin note, **98**, denoting the affected area.

The Addenda for 1999 and 2000 will also have a Summary of Changes and identifiers printed on the replacement pages. The revisions, additions, or deletions will be incorporated directly into the affected pages. It is advisable to retain the title sheets and all replaced pages for reference.

The effective dates for Code Editions and Addenda are described in the Foreword.

Date of Issue - July 1, 1998

(Includes all Addenda dated December 1997 and earlier)

This code or standard was developed under procedures accredited as meeting the criteria for American National Standards. The Standards Committee that approved the code or standard was balanced to assure that individuals from competent and concerned interests have had an opportunity to participate. The proposed code or standard was made available for public review and comment which provides an opportunity for additional public input from industry, academia, regulatory agencies, and the public-at-large.

ASME does not "approve," "rate," or "endorse" any item, construction, proprietary device, or activity.

ASME does not take any position with respect to the validity of any patent rights asserted in connection with any items mentioned in this document, and does not undertake to insure anyone utilizing a standard against liability for infringement of any applicable Letters Patent, nor assume any such liability. Users of a code or standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, is entirely their own responsibility.

Participation by federal agency representative(s) or person(s) affiliated with industry is not to be interpreted as government or industry endorsement of this code or standard.

ASME accepts responsibility for only those interpretations issued in accordance with governing ASME procedures and policies which preclude the issuance of interpretations by individual volunteers.

The footnotes in this document are part of this American National Standard.

ADDENDA

Colored-sheet Addenda, which include additions and revisions to individual Sections of the Code, are published annually and will be sent automatically to purchasers of the applicable Sections up to the publication of the 2001 Code. The 1998 Code is available only in the loose-leaf format; accordingly, the Addenda will be issued in the loose-leaf, replacement-page format.

INTERPRETATIONS

ASME issues written replies to inquiries concerning interpretation of technical aspects of the Code. The Interpretations for each individual Section will be published separately and will be included as part of the update service to that Section. They will be issued semiannually (July and December) up to the publication of the 2001 Code. Interpretations of Section III, Divisions 1 and 2, will be included with the update service to Subsection NCA.

CODE CASES

The Boiler and Pressure Vessel Committee meets regularly to consider proposed additions and revisions to the Code and to formulate Cases to clarify the intent of existing requirements or provide, when the need is urgent, rules for materials or constructions not covered by existing Code rules. Those Cases which have been adopted will appear in the appropriate 1998 Code Cases book: (1) Boilers and Pressure Vessels and (2) Nuclear Components. Supplements will be sent automatically to the purchasers of the Code Cases books up to the publication of the 2001 Code.

Page v

FOREWORD

The American Society of Mechanical Engineers set up a committee in 1911 for the purpose of formulating standard rules for the construction of steam boilers and other pressure vessels. This committee is now called the Boiler and Pressure Vessel Committee.

The Committee's function is to establish rules of safety governing the design, fabrication, and inspection during construction of boilers and pressure vessels, and to interpret these rules when questions arise regarding their intent. In formulating the rules, the Committee considers the needs of users, manufacturers, and inspectors of pressure vessels. The objective of the rules is to afford reasonably certain protection of life and property and to provide a margin for deterioration in service so as to give a reasonably long, safe period of usefulness. Advancements in design and material and the evidence of experience have been recognized.

This Code contains mandatory requirements, specific prohibitions, and nonmandatory guidance for construction,¹ and inservice inspection and testing activities. The Code does not address all aspects of these activities and those aspects which are not specifically addressed should not be considered prohibited. The Code is not a handbook and cannot replace education, experience, and the use of engineering judgment. The phrase *engineering judgment* refers to technical judgments made by knowledgeable engineers experienced in the application of the Code. Engineering judgments must be consistent with Code philosophy and such judgments must never be used to overrule mandatory requirements or specific prohibitions of the Code.

¹ Construction, as used in this Foreword, is an all-inclusive term comprising materials, design, fabrication, examination, inspection, testing, certification, and pressure relief.

The Committee recognizes that tools and techniques used for design and analysis change as technology progresses and expects engineers to use good judgment in the application of these tools. The designer is responsible for complying with Code rules and demonstrating compliance with Code equations when such equations are mandatory. The Code neither requires nor prohibits the use of computers for the design or analysis of components constructed to the requirements of the Code. However,

designers and engineers using computer programs for design or analysis are cautioned that they are responsible for all technical assumptions inherent in the programs they use and they are responsible for the application of these programs to their design.

The Code does not fully address tolerances. When dimensions, sizes, or other parameters are not specified with tolerances, the values of these parameters are considered nominal and allowable tolerances or local variances may be considered acceptable when based on engineering judgment and standard practice as determined by the engineer.

The Boiler and Pressure Vessel Committee deals with the care and inspection of boilers and pressure vessels in service only to the extent of providing suggested rules of good practice as an aid to owners and their inspectors.

The rules established by the Committee are not to be interpreted as approving, recommending, or endorsing any proprietary or specific design or as limiting in any way the manufacturer's freedom to choose any method of design or any form of construction that conforms to the Code rules.

The Boiler and Pressure Vessel Committee meets regularly to consider revisions of the rules, new rules as dictated by technological development, Code Cases, and requests for interpretations. Only the Boiler and Pressure Vessel Committee has the authority to provide official interpretations of this Code. Requests for revisions, new rules, Code Cases, or interpretations shall be addressed to the Secretary in writing and shall give full particulars in order to receive consideration and action (see Mandatory Appendix covering preparation of technical inquiries). Proposed revisions to the Code resulting from inquiries will be presented to the Main Committee for appropriate action. The action of the Main Committee becomes effective only after confirmation by letter ballot of the Committee and approval by ASME.

Proposed revisions to the Code approved by the Committee are submitted to the American National Standards Institute and published in *Mechanical Engineering*

Page viii

to invite comments from all interested persons. After the allotted time for public review and final approval by ASME, revisions are published annually in Addenda to the Code.

Code Cases may be used in the construction of components to be stamped with the ASME Code symbol beginning with the date of their approval by ASME.

Code Editions may be used on or after the date of issue shown in the Edition. After Code revisions are approved by ASME, they may be used beginning with the date of issue shown on the Addenda. Revisions to material specifications are originated by the American Society for Testing and Materials (ASTM) and other recognized national or international organizations, and are usually adopted by ASME. However, those revisions may or may not have any effect on the suitability of material, produced to earlier editions of specifications, for use in ASME construction. ASME material specifications approved for use in each construction Code are listed in the Appendices of Section II, Parts A and B. These Appendices list, for each specification, the latest edition adopted by ASME, and earlier and later editions considered by ASME to be identical for ASME construction.

Owners of nuclear power plants are cautioned that Code Editions, Addenda, and Cases to be used in construction shall be acceptable to the regulatory and enforcement authorities having jurisdiction at the nuclear power plant site.

Each state and municipality in the United States and each province in Canada that adopts or accepts one or more Sections of the Boiler and Pressure Vessel Code is invited to appoint a representative to act on the Conference Committee to the Boiler and Pressure Vessel Committee. Since the members of the Conference Committee are in active contact with the administration and enforcement of the rules, the requirements for inspection in this Code correspond with those in effect in their respective jurisdictions. The required qualifications for an Authorized Inspector under these rules may be obtained from the administrative authority of any state, municipality, or province which has adopted these rules.

The Boiler and Pressure Vessel Committee in the formulation of its rules and in the establishment of maximum design and operating pressures considers materials, construction, method of fabrication, inspection, and safety devices. Permission may be granted to regulatory bodies and organizations publishing safety standards to use a complete Section of the Code by reference. If usage of a Section, such as Section IX, involves exceptions, omissions, or changes in provisions, the intent of the Code might not be attained.

Where a state or other regulatory body, in the printing of any Section of the Boiler and Pressure Vessel Code, makes

additions or omissions, it is recommended that such changes be clearly indicated.

The National Board of Boiler and Pressure Vessel Inspectors is composed of chief inspectors of states and municipalities in the United States and of provinces in Canada that have adopted the Boiler and Pressure Vessel Code. This Board, since its organization in 1919, has functioned to uniformly administer and enforce the rules of the Boiler and Pressure Vessel Code. The cooperation of that organization with the Boiler and Pressure Vessel Committee has been extremely helpful.

The Code Committee does not rule on whether a component shall or shall not be constructed to the provisions of the Code. The Scope of each Section has been established to identify the components and parameters considered by the Committee in formulating the Code rules. Laws or regulations issued by municipality, state, provincial, federal, or other enforcement or regulatory bodies having jurisdiction at the location of an installation establish the mandatory applicability of the Code rules, in whole or in part, within their jurisdiction. Those laws or regulations may require the use of this Code for vessels or components not considered to be within its Scope or may establish additions or deletions in that Scope. Accordingly, inquiries regarding such laws or regulations are to be directed to the issuing enforcement or regulatory body.

Questions or issues regarding compliance of a specific component with the Code rules are to be directed to the ASME Certificate Holder (Manufacturer). Inquiries concerning the interpretation of the Code are to be directed to the ASME Boiler and Pressure Vessel Committee. ASME is to be notified should questions arise concerning improper use of an ASME Code symbol.

The specifications for materials given in Section II are identical with or similar to those of specifications published by ASTM, AWS, and other recognized national or international organizations. When reference is made in an ASME material specification to a non-ASME specification for which a companion ASME specification exists, the reference shall be interpreted as applying to the ASME material specification. Not all materials included in the material specifications in Section II have been adopted for use in this Section. Usage is limited to those materials and grades listed in at least one of the tables of Section II, Part D, Subpart 1, identified as applicable to this Section. All materials allowed by this Section and used for construction within the scope of these rules shall be furnished in accordance with material specifications

Page ix

contained in Section II or referenced in Appendices A of Section II, Parts A and B except where otherwise provided in Code Cases or in this Section of the Code. Materials covered by these specifications are acceptable for use in items covered by the Code Sections only to the degree indicated in the applicable Section. Materials for Code use should preferably be ordered, produced, and documented on this basis. Material produced to an acceptable specification with requirements different from the requirements of the corresponding specification listed in Appendix A of Part A or Part B may also be used in accordance with the above, provided the material manufacturer or vessel manufacturer certifies with evidence acceptable to the Authorized Inspector that the corresponding ASME specification requirements of specifications listed in Appendix A of Part A or Part B have been met. Material produced to an acceptable material specification is not limited as to country of origin.

When required by context in this Section, the singular shall be interpreted as the plural, and vice-versa; and the feminine, masculine, or neuter gender shall be treated as such other gender as appropriate.

Publication of the SI (Metric) Edition of the ASME Boiler and Pressure Vessel Code was discontinued with the 1986 Edition. Effective October 1, 1986, the SI Edition was withdrawn as an ASME Boiler and Pressure Vessel Code document.

Page xi

STATEMENT OF POLICY ON THE USE OF CODE SYMBOLS AND CODE AUTHORIZATION IN ADVERTISING

ASME has established procedures to authorize qualified organizations to perform various activities in accordance with the requirements of the ASME Boiler and Pressure Vessel Code. It is the aim of the Society to provide recognition of organizations so authorized. An organization holding authorization to perform various activities in accordance with the requirements of the Code may state this capability in its advertising literature.

Organizations that are authorized to use Code Symbols for marking items or constructions which have been constructed and inspected in compliance with the ASME Boiler and Pressure Vessel Code are issued Certificates of Authorization. It is the aim of the Society to maintain the standing of the Code Symbols for the benefit of the users, the enforcement jurisdictions, and the holders of the symbols who comply with all requirements.

Based on these objectives, the following policy has been established on the usage in advertising of facsimiles of the symbols,

Certificates of Authorization, and reference to Code construction. The American Society of Mechanical Engineers does not "approve," "certify," "rate," or "endorse" any item, construction, or activity and there shall be no statements or implications which might so indicate. An organization holding a Code Symbol and/or a Certificate of Authorization may state in advertising literature that items, constructions, or activities "are built (produced or performed) or activities conducted in accordance with the requirements of the ASME Boiler and Pressure Vessel Code," or "meet the requirements of the ASME Boiler and Pressure Vessel Code."

The ASME Symbol shall be used only for stamping and nameplates as specifically provided in the Code. However, facsimiles may be used for the purpose of fostering the use of such construction. Such usage may be by an association or a society, or by a holder of a Code Symbol who may also use the facsimile in advertising to show that clearly specified items will carry the symbol. General usage is permitted only when all of a manufacturer's items are constructed under the rules.

The ASME logo, which is the cloverleaf with the letters ASME within, shall not be used by any organization other than ASME.

STATEMENT OF POLICY ON THE USE OF ASME MARKING TO IDENTIFY MANUFACTURED ITEMS

The ASME Boiler and Pressure Vessel Code provides rules for the construction of boilers, pressure vessels, and nuclear components. This includes requirements for materials, design, fabrication, examination, inspection, and stamping. Items constructed in accordance with all of the applicable rules of the Code are identified with the official Code Symbol Stamp described in the governing Section of the Code.

Markings such as "ASME," "ASME Standard," or any other marking including "ASME" or the various Code Symbols shall not be used on any item which is not constructed in accordance with all of the applicable requirements of the Code.

Items shall not be described on ASME Data Report Forms nor on similar forms referring to ASME which tend to imply that all Code requirements have been met when, in fact, they have not been. Data Report Forms covering items not fully complying with ASME requirements should not refer to ASME or they should clearly identify all exceptions to the ASME requirements.

ORGANIZATION OF SECTION III

1. GENERAL

Section III consists of Division 1, Division 2, and Division 3. These Divisions are broken down into Subsections and are designated by capital letters preceded by the letter "N" for Division 1, by the letter "C" for Division 2, and by the letter "W" for Division 3. The following eleven books make up the three Divisions.

Subsection NCA - General Requirements for Division 1 and Division 2

Division 1

Subsection NB - Class 1 Components
Subsection NC - Class 2 Components
Subsection ND - Class 3 Components
Subsection NE - Class MC Components
Subsection NF - Supports
Subsection NG - Core Support Structures
Subsection NH - Class 1 Components in Elevated Temperature Service
Appendices

Division 2 - Code for Concrete Reactor Vessels and Containments

Division 3 - Containment Systems and Transport Packagings for Spent Nuclear Fuel and High Level Radioactive Waste

The Division 2 book includes Subsection CC - Concrete Containments and Division 2 Appendices.

The Division 3 book includes Subsections WA and WB for General Requirements and Class TP (Type B) Containment, respectively.

2. SUBSECTIONS

Subsections are divided into Articles, Subarticles, paragraphs, and, where necessary, subparagraphs and subsubparagraphs.

3. ARTICLES

Articles are designated by the applicable letters indicated above for the Subsections followed by Arabic numbers, such as NB-1000. Where possible, Articles dealing with the same topics are given the same number in each Subsection in accordance with the following general scheme:

Article Number	Title
1000	Introduction or Scope
2000	Material
3000	Design
4000	Fabrication and Installation
5000	Examination
6000	Testing
7000	Overpressure Protection
8000	Nameplates, Stamping, and Reports

The numbering of Articles and the material contained in the Articles may not, however, be consecutive. Due to the fact that the complete outline may cover phases not applicable to a particular Subsection or Article, the rules have been prepared with some gaps in the numbering.

4. SUBARTICLES

Subarticles are numbered in units of 100, such as NB-1100.

5. SUBSUBARTICLES

Subsubarticles are numbered in units of 10, such as NB-2130, and generally have no text. When a number such as NB-1110 is followed by text, it is considered a paragraph.

6. PARAGRAPHS

Paragraphs are numbered in units of 1, such as NB-2121.

7. SUBPARAGRAPHS

Subparagraphs, when they are *major* subdivisions of a paragraph, are designated by adding a decimal followed by one or more digits to the paragraph number, such as NB-1132.1. When they are *minor* subdivisions of a paragraph, subparagraphs may be designated by lowercase letters in parentheses, such as NB-2121(a).

8. SUBSUBPARAGRAPHS

Subsubparagraphs are designated by adding lowercase letters in parentheses to the *major* subparagraph numbers, such as NB-1132.1(a). When further subdivisions of *minor* subparagraphs are necessary, subsubparagraphs are designated by adding Arabic numerals in parentheses to the subparagraph designation, such as NB-2121(a)(1).

Page xxiv

9. REFERENCES

References used within Section III generally fall into one of the following four categories.

A. References to Other Portions of Section III

When a reference is made to another Article, Subarticle, or paragraph, all numbers subsidiary to that reference shall be included. For example, reference to NB-3000 includes all material in Article NB-3000; reference to NB-3200 includes all material in Subarticle NB-3200; reference to NB-3230 includes all paragraphs NB-3231 through NB-3236.

B. References to Other Sections

Other Sections referred to in Section III are:

Section II, Materials. When a requirement for a material, or for the examination or testing of a material, is to be in accordance with a specification such as SA-105, SA-370, or SB-160, the reference is to material specifications in Section II. These references begin with the letter "S."

Section V, Nondestructive Examination. Section V references begin with the letter "T" and relate to the nondestructive examination of material or welds.

Section IX, Welding and Brazing Qualifications. Section IX references begin with the letter "Q" and relate to welding and brazing requirements.

Section XI, Rules for Inservice Inspection of Nuclear Power Plant Components. When a reference is made to inservice inspection, the rules of Section XI shall apply.

C. Reference to Specifications and Standards Other Than Published in Code Sections

(1) Specifications for examination methods and acceptance standards to be used in connection with them are published by the American Society for Testing and Materials. At the time of publication of Section III, some such specifications were not included in Section II of this Code. A reference to ASTM E 71-64 refers to the specification so designated by and published by ASTM, 100 Barr Harbor Drive, West Conshohocken, PA 19428.

2 The American National Standards Institute (ANSI) was formerly known as the American Standards Association. Standards approved by the Association were designated by the prefix "ASA" followed by the number of the standard and the year of publication. More recently, the American National Standards Institute was known as the United States of America Standards Institute. Standards were designated by the prefix "USAS" followed by the number of the standard and the year of publication. While the letters of the prefix have changed with the name of the organization, the numbers of the standards have remained unchanged.

(2) Dimensional standards covering products such as valves, flanges, and fittings are sponsored and published by the American Society of Mechanical Engineers and approved by the American National Standards Institute.² When a product is to conform to such a standard, for example ANSI B16.5, the standard is approved by the American National Standards Institute. The applicable year of issue is that suffixed to its numerical designation in Table NB-3132-1, for example ANSI B16.5-1977. Standards published by the American Society of Mechanical Engineers are available from ASME, 22 Law Drive, Box 2300, Fairfield, NJ 07007-2300.

(3) Dimensional and other types of standards covering products such as valves, flanges, and fittings are also published by the Manufacturers Standardization Society of the Valve and Fittings Industry and are known as Standard Practices. When a product is required by these rules to conform to a Standard Practice, for example MSS SP-6, the Standard Practice referred to is published by the Manufacturers Standardization Society of the Valve and Fittings Industry, 127 Park Street, N.E., Vienna, VA 22180. The applicable year of issue of such a Standard Practice is that suffixed to its numerical designation in Table NB-3132-1, for example MSS SP-6-1963.

(4) Specifications for welding and brazing materials are published by the American Welding Society, 550 N.W. LeJeune Road, Miami, FL 33135. Specifications of this type are incorporated in Section II and are identified by the AWS designation with the prefix "SF," for example SFA-5.1.

(5) Standards applicable to the design and construction of tanks and flanges are published by the American Petroleum Institute and have designations such as API-620 and API-2000. When documents so designated are referred to in Section III, they are standards published by the American Petroleum Institute.

D. References to Appendices

Two types of Appendices are used in Section III and are designated Mandatory and Nonmandatory.

(1) Mandatory Appendices contain requirements which must be followed in construction; such references are designated by a Roman numeral followed by Arabic numerals. References to II-1100 or XI-3212, for example, relate to the Mandatory Appendices.

(2) Nonmandatory Appendices provide information or guidance for the use of Section III; such references are designated by a capital letter followed by Arabic numerals. A reference to D-1100, for example, relates to a Nonmandatory Appendix.

a capital letter followed by Arabic numerals. A reference to D-1100, for example, relates to a Nonmandatory Appendix.

July 1, 1998

American Society Of Mechanical Engineers

SEC III D3 WA-1000

ARTICLE WA-1000 SCOPE OF DIVISION 3

Page 1

SUBSECTION WA

GENERAL REQUIREMENTS

Page 3

WA-1100 SCOPE

WA-1110 NATURE OF THESE RULES AND COMPONENTS TO WHICH THEY ARE APPLICABLE

The rules of Division 3 constitute requirements for the design and construction of the containment system of a nuclear spent fuel or high level radioactive waste transport packaging.

WA-1120 DEFINITIONS

Definitions of key terms used in Subsection WA are included in WA-9000.

WA-1130 LIMITS OF THESE RULES

(a) The rules of this Division provide requirements for new design construction including consideration of mechanical and thermal stresses due to cyclic operation. They do not cover deterioration which may occur in service as a result of radiation effects, corrosion, erosion, or instability of the material. These effects shall be taken into account with a view to realizing the design or the specified life.

(b) The rules are not intended to be applicable to any item that does not serve a pressure retaining function.

WA-1140 USE OF CODE EDITIONS, ADDENDA, AND CASES

(a)(1) The Design Owner or his designee shall establish the Code Edition and Addenda to be included in the Design Specification. All items shall be designed to a single Code Edition and Addenda.

(2) In no case shall the Code Edition and Addenda dates established in the Design Specifications be earlier than one year prior to the date of filing an application for Certificate of Compliance for a transport package with the Regulatory Authority.

(b) The Class TP Certificate Holder shall construct the containment system under the provisions of a Quality Assurance Program which has been accepted by the Society. The Quality Assurance Program shall meet the requirements of the latest Division 3 Edition and Addenda issued at the time that the containment system is constructed.

(c) Code Cases are permissible and may be used beginning with the date of approval by the ASME Council. Only Code Cases that are specifically identified as being applicable to this Section may be used. Code Cases may be used by mutual consent of the parties involved.

(d) Materials produced and certified in accordance with Code Editions and Addenda other than the one specified in the Design Specification, may be used, provided all of the following requirements are satisfied.

(1) The material (WA-1220) meets the applicable requirements of a material specification permitted by WB-2121 of the

Edition and Addenda specified for construction.

(2) The material meets all the requirements of WB-2000 of the Edition and Addenda specified for construction.

(3) The material was produced under the provisions of a Quality System Program which had been accepted by the Society or qualified by a party other than the Society (WA-3820), in accordance with the requirements of the latest Division 3 Edition and Addenda issued at the time the material was produced. Material exempted from portions of the provisions of WA-3800 by WB-2610 may be used, provided the requirements of (1) and (2) above are met.

WA-1200 GENERAL REQUIREMENTS

WA-1210 COMPONENTS

Piping and valves may form part of the containment system. If piping and valves are included in the containment

Page 6

system they shall be designed and constructed in accordance with Section III, Division 1, Class 1.

WA-1220 MATERIALS

WA-1221 Metallic Materials

Metallic materials shall be manufactured to an SA, SB, or SFA Specification,¹ or any other material specification permitted by WB-2121. Such material shall be manufactured, identified, and certified in accordance with the requirements of this Division. Tubular products and fittings welded with filler metal shall meet the requirements of Section III, Division 1, Class 1.

¹ SA or SB Specifications listed under the heading Bars, Rods, Shapes, Forgings may be used as material for any of these product forms even though not all product forms are listed in the SA or SB Specification.

WA-1222 Metallic Material, ASTM Specification

Metallic materials produced under an ASTM designation may be accepted as complying with the corresponding ASME Specification, provided the ASME Specification is designated as being identical with the ASTM Specification for the grade, class, or type produced and provided that the material is confirmed as complying with the ASTM Specification by a Certified Material Test Report or Certificate of Compliance from the Material Manufacturer.

WA-1223 Welding Material, AWS Specification

Welding material produced under an AWS designation may be accepted as complying with the corresponding ASME Specification, provided the latter Specification is indicated to be identical with the AWS Specification and provided the welding material is confirmed as complying with the AWS Specification by a Certified Material Test Report or Certification from the Material Manufacturer.

WA-1230 PARTS AND PIPING SUBASSEMBLIES

Parts or piping subassemblies may form part of the containment system. The Design Specification and Design Reports for such parts or piping subassemblies shall meet the requirements of WA-3250 and WA-3550, as applicable. If the construction of such parts or piping subassemblies are subcontracted to others, the subcontractor shall possess a valid Class TP Certificate of Authorization or a valid NPT Certificate of Authorization for Class 1 construction.

July 1, 1998

American Society Of Mechanical Engineers

SEC III D3 WA-2000

ARTICLE WA-2000 DESIGN BASIS FOR CONTAINMENT
SYSTEMS FOR TRANSPORT PACKAGINGS

WA-2100 GENERAL REQUIREMENTS

WA-2110 SCOPE

Rules for the design of containment systems for transport packagings are provided in WB-3000. The Design Owner shall be responsible for establishing a Design Specification which identifies design and safety criteria for the design of the containment system in accordance with the rules of Division 3.

WA-2120 DESIGN BASIS

WA-2121 Consideration of Operating Conditions

(a) Containment systems of transport packagings (WA-1110) are subject to operating conditions which are required to be considered in the design of the transport packaging in order to satisfy applicable safety criteria.

(b) Operating conditions for transport packagings are classified as either normal operating conditions or hypothetical accident conditions. Normal operating conditions include normal conditions of transport and in-plant handling conditions.

(c) As a consequence of specified operating conditions, containment systems are subject to pressure, temperature, and mechanical loadings. The resulting stresses in the containment system shall not exceed the Limits provided in this Division.

(d) The selection of operating conditions, and the determination of their significance to the design and operability of the containment system, are beyond the scope of this Division. Appropriate guidance for the selection of operating conditions may be derived from safety criteria documents for transport packagings and the requirements of regulatory and enforcement authorities having jurisdiction.

WA-2122 Consideration of Test Conditions

(a) Each containment system shall be subjected to a pressure test (WB-6000). The minimum test pressure shall not be less than either 1.5 times MNOP¹ or 1.25 times MNIP². The stress produced in the containment system during the test shall not exceed the limits provided in WB-3220 and WB-3330.

(b) Other proof tests may be specified by the Design Owner in the Design Specification. Stresses produced in the containment system by such a test shall not exceed the limits specified for normal operating conditions.

WA-2123 Establishment of Loadings, Stresses, and Limits

(a) In the Design Specification, the Design Owner shall identify all operating and test conditions anticipated or postulated to occur during the intended service life of the transport packaging.

(b) The Design Owner shall determine the resulting loads and combinations of loads on the containment system by considering the entire transport packaging. The Design Owner shall select all critical loads for evaluation of stresses against the Limits provided in this Division.

(c) Stresses are induced by the pressure, temperature, and mechanical loads, and combinations thereof, and shall be classified as either Primary, Secondary or Peak Stresses by the Design Owner in accordance with the requirements of WB-3000.

¹ Maximum Normal Operating Pressure (MNOP) is the maximum pressure that would develop in the containment system in a period of one year under normal conditions of transport without venting.

² Maximum Normal In-plant Handling Pressure (MNIP) is the maximum pressure that would develop in the containment system under the most severe conditions of normal in-plant handling operations.

(d) Normal Limits are those sets of limits which must be satisfied for all normal operating conditions identified in the Design Specification. The stress limits which must be satisfied for normal loads are provided in WB-3220 and WB-3230.

(e) Accident Limits are those sets of limits which must be satisfied for all hypothetical accident conditions identified in the Design Specification. The stress limits which must be satisfied for accident loads are provided in WB-3220 and WB-3230.

WA-2130 SPECIAL REQUIREMENTS

Contractual arrangements between the Design Owner and Packaging Owner and the Class TP Certificate Holder which specify requirements in addition to, or more restrictive than, those specified by the rules of this Division may be applied, provided such requirements do not negate any rules of this Division. Such special contractual requirements are beyond the scope of this Division and shall not apply as conditional requirements for Code construction.

July 1, 1998

American Society Of Mechanical Engineers

SEC III D3 WA-3000

ARTICLE WA-3000 RESPONSIBILITIES AND DUTIES

Page 11

WA-3100 GENERAL

WA-3110 RESPONSIBILITIES VS. LEGAL LIABILITIES

The parties identified in WA-3111, WA-3113, and WA-3114 are involved in the design and construction of containment systems for transport packagings or items which come under the jurisdiction of this Division. Each party has specific duties and responsibilities as set forth in WA-3220, WA-3420, and WA-3520. The responsibilities relate only to Code compliance and are not to be construed as involving contractual or legal liabilities. A single organization may perform one or more of the roles assigned to each party.

WA-3111 DESIGN OWNER

The Design Owner is the organization which obtains a Certificate of Accreditation issued by the Society. The Design Owner or his designee prepares a Design Specification, causes a design to be developed, obtains a Certificate of Compliance or an Amendment to a Certificate of Compliance for a specific design of a transport packaging from the regulatory authority, determines the loads applied to the containment system, designs the containment system, demonstrates the adequacy of the design of the containment system, and issues a Design Report and other Design Documents required by this Division.

WA-3113 PACKAGING OWNER

The Packaging Owner is the organization which assumes title to the transport packaging upon delivery by the Class TP Certificate Holder. The Packaging Owner, or his designee, initiates construction of the containment system through the issuance of a Construction Specification.

WA-3114 CLASS TP CERTIFICATE HOLDER

The Class TP Certificate Holder is the organization which constructs the containment system as part of the transport packaging in accordance with the requirements of the Construction Specification. The Class TP Certificate Holder obtains an N-type Certificate of Authorization issued by the Society, completes the appropriate Data Report Form and applies a Code Symbol Stamp to the completed containment system of a transport packaging.

WA-3120 AUTHORIZATION

WA-3121 Types of Authorization

Table WA-8100-1 lists the types of certificates issued by the Society and indicates the responsibilities assumed by each Certificate Holder. Further details of these responsibilities are contained in this Article.

WA-3122 Subcontracted Services

(a) Services may be subcontracted which are both within and beyond the scope of this Division. There are no requirements for the subcontracting of services beyond the scope of this Division. Services covered by this Division may either be of a type for which the Society issues Certificates, or may be of the type for which the Society does not issue a Certificate. Subcontracts for activities for which Certificates are required shall be made only to Certificate Holders. The Certificate Holder may subcontract to another organization the surveying and auditing of his subcontractors and Material Organizations, but must retain the responsibility for these activities and for the qualification of these subcontractors and Material Organizations.

(b) A Class TP Certificate Holder may subcontract the construction of parts to a Section III, Division 1 Class 1 NPT Certificate Holder provided the scope of

Page 16

work is included in the scope of the subcontractor's N-type Certificate of Authorization.

(c) The Certificate Holder shall describe in his Quality Assurance Manual the manner in which he controls and accepts the responsibility for the subcontracted activities.

WA-3130 WELDING AND SUBCONTRACTING DURING CONSTRUCTION

Division 3 requires that all welding during Code construction be done only by an organization holding the N-type Certificate of Authorization appropriate to the scope of welding to be performed. A Certificate Holder may engage individuals by contract for their services as welders or welding operators at the location shown on the N-type Certificate of Authorization.

WA-3200 DESIGN OWNER'S RESPONSIBILITIES

WA-3210 DEFINITION OF DESIGN OWNER

The term Design Owner, as used in this division, is defined in WA-3111.

WA-3220 CATEGORIES OF THE DESIGN OWNER'S RESPONSIBILITIES

The responsibilities of the Design Owner include the requirements of (a) through (s) below as applicable:

(a) obtaining a Certificate of Compliance or an Amendment to a Certificate of Compliance for a specific design of a transport package from the regulatory authority;

(b) obtaining a Design Owner's Certificate of Accreditation (WA-3230);

(c) documenting a Quality Assurance Program (WA-3272);

(d) obtaining a written agreement with an Authorized Inspection Agency (WA-3230 and WA-8130);

(e) establishing the Code Editions, Addenda, and Code Cases to be used in the Design Specifications, and determining that they are acceptable to the regulatory and enforcement authorities (WA-1140);

(f) providing and correlating Design specification, including establishment of component and system boundaries (WA-3251);

(g) certifying the Design Specification (WA-3255);

(h) providing Design Specification and Design Documents to the regulatory authority, Packaging and Owner and Class TP Certificate Holder, as applicable;

(i) preparing a design of a transport packaging, including the containment system, in accordance with the Design Specification and this Division;

- (j) preparing and certifying Design Documents required by this Division (WA-3260);
- (k) determining the loads applied to the containment system by evaluating the entire transport packaging;
- (l) performing a stress analysis of the containment system and verifying that the limits of this Division are not exceeded (WA-3260);
- (m) providing Design Documents for review and approval (WA-3260);
- (n) performing any of the requirements of (i) through (m) above, with regard to changes to the design after the initial issuance of the Design Documents (WA-3262);
- (o) reviewing Design Reports (WA-3264);
- (p) making available to the Inspector the documents specified by this Division and those requested by the Inspector to ensure compliance with Code requirements (WA-5242);
- (q) designating records to be maintained and providing for their maintenance (WA-3280);
- (r) revising Design Specifications and Design Documents to accommodate construction modifications (WA-3570);
- (s) performing other duties as assigned to the Design Owner throughout this Division.

The activities necessary to provide compliance with responsibilities assigned to the Design Owner above may be performed on behalf of the Design Owner by a designee; however, the responsibility for compliance remains with the Design Owner.

WA-3230 DESIGN OWNER'S CERTIFICATE OF ACCREDITATION

The Design Owner shall obtain a Design Owner's Certificate of Accreditation from the Society prior to the issuance of a Design specification. The information to be supplied by the Design Owner when making applications is given in forms issued by the Society. A written agreement with an Authorized Inspection Agency (WA-8130) is required prior to application.

Page 17

WA-3250 PROVISION OF DESIGN SPECIFICATIONS

WA-3251 Provision and Correlation

It is the responsibility of the Design Owner to prepare, certify, and issue the Design Specification for the containment system. The Design Owner, shall also be responsible for the proper correlation of all Design Specifications. Separate Design Specifications are not required for parts or piping subassemblies, for valves, piping systems and parts that form part of the containment system which are prepared by other organizations when they are included in the Design Specification for a containment system for a transport package (WA-1230).

WA-3252 Contents of Design Specifications

(a) The Design Specifications shall contain sufficient detail to provide a complete basis for design and construction in accordance with this Division. Such requirements shall not result in design or construction which fails to conform with the rules of this Division. All Design Specifications shall include (1) through (6) below:

- (1) the functions and boundaries of the items covered (WA-3254);
- (2) the design requirements (WA-2000);
- (3) the environmental conditions, including radiation;
- (4) material requirements including impact test requirements;
- (5) when operability of a component is a consideration, the Design Specification shall make reference to other appropriate documents which specify the operating requirements;

(6) the effective Code Edition, Addenda, and Code Cases to be used for design and construction.

WA-3254 Boundaries of Jurisdiction

In order to define the boundaries of components with respect to adjacent components and other structures, the Design Specifications shall include:

- (a) the locations of each such boundary within the containment system;
- (b) the structural characteristics of the adjacent and attached components or structures, whether or not they are within this Division's jurisdiction when such components or structures provide constraints to the movement of components;
- (c) the boundary of the Class TP containment system as given in WB-1120.

WA-3255 Certification of the Design Specifications

The Design Specifications shall be certified to be correct and complete and to be in compliance with the requirements of WA-3250 by one or more Registered Professional Engineers, competent in the applicable field of design and related transport packaging requirements and qualified in accordance with the requirements of ANSI/ASME N626.3. Such Registered Professional Engineers are not required to be independent of the organization preparing the Design Specifications.

WA-3260 REQUIREMENTS FOR DESIGN DOCUMENTS

WA-3261 Design Documents

- (a) The Design and the Design Drawings used for construction are the primary Design Documents. The design shown by the Design Drawings shall comply with the Design Specification and the rules of this Division and shall be in agreement with the other Design Documents. The Design Report shall demonstrate the adequacy of the design with regard to the structural integrity of the containment system.
- (b) The Design Owner may subcontract stress analysis or complete design of all or a portion of a component. However, the Design Owner is responsible for the design of the containment system and for the Design Documents.
- (c) The Design Drawings shall be in agreement with the Design Report before it is certified (WA-3263) and shall be identified and described in the Design Report.
- (d) When the design includes parts or piping subassemblies which are to be purchased from an NPT Certificate Holder or valves which are to be purchased from an N Certificate Holder, the Design Owner shall incorporate the Design Documents for the purchased items into the Design Documents of the containment system.
- (e) The Design Owner shall demonstrate the adequacy of the design of any piping subassembly, part, or valve within the boundary of the containment system to meet the requirements of the Design Specification and this Division. This demonstration shall be included the Design Report for the containment system.

WA-3262 Modification of Document and Reconciliation With Design Report

Any modification of any document used for design from the corresponding document used for design analysis,

Page 18

shall be reconciled with the Design Report by the person or organization responsible for the design. A revision or addenda to the Design Report shall be prepared and certified (WA-3263) to indicate the basis on which this has been accomplished. All such revised documentation shall be filed with the completed Design Report.

WA-3263 Certification of Design Report

- (a) The Design Report shall be certified to be correct and complete and to be in accordance with the requirements of WA-3260 by one or more Registered Professional Engineers competent in the applicable field of design and related transport packaging requirements and qualified in accordance with the requirements of ANSI/ASME N626.3. The Design Report shall be certified only after all design requirements of this Division have been met. Such Registered Professional

Report shall be certified only after all design requirements of this Division have been met. Such Registered Professional Engineers are not required to be independent of the organization preparing the design.

(b) It is the intent of this Division that the certification of the Design Report shall in no way relieve the Design Owner of the responsibility for ensuring that the design of the containment system meets the conditions stated in the Design Specification and this Division.

WA-3264 Review of Design Report

(a) The Certified Design Report shall be reviewed by the Design Owner to determine that all Operating Conditions described in the Design Specification have been considered, and that the acceptance criteria established in the Design Specification and in this Division have been met. The Certified Design Report shall be reviewed by the individuals who did prepare the design report.

(b) Documentation shall be provided by the Design Owner to indicate that the review required by (a) above has been completed.

(c) A copy of the documentation required by (b) above shall be attached to, and become part of the Design Report.

(d) A copy of the completed Design Report, including the documentation required by (b) above shall be made available to the Packaging Owner before construction begins.

WA-3270 RESPONSIBILITY FOR QUALITY ASSURANCE

WA-3271 Scope of Responsibilities

(a) The Design Owner shall be responsible for surveying, qualifying, and auditing suppliers of subcontracted services (WA-3122). Subcontractors holding an appropriate Certificate need not be surveyed nor audited for work within the scope of the subcontractor's Certificate.

(b) A Design Owner may qualify vendors of subcontracted services (WA-3122) other than those requiring a Certificate for another Certificate Holder doing work for that Design Owner. The qualification documentation shall be supplied to the other Certificate Holder prior to their use of the subcontracted service.

WA-3272 Documentation of Quality Assurance Program

The Design Owner shall be responsible for documenting its Quality Assurance Program (WA-4134).

WA-3273 Filing of Quality Assurance Manual

The Design Owner shall file with the Authorized Inspection Agency (WA-5121) copies of the Quality Assurance Manual. The Design Owner shall keep a copy on file available to the Inspector (WA-5122).

WA-3280 DESIGN OWNER'S RESPONSIBILITY FOR RECORDS

The Design Owner shall be responsible for designating the records to be maintained (WA-4134.17). The Design Owner shall also be responsible for the maintenance of records required by this Division (WA-4134.17).

WA-3400 PACKAGING OWNER'S RESPONSIBILITIES

WA-3410 DEFINITION OF PACKAGING OWNER

The term Packaging Owner, as used in this Division, is defined in WA-3113.

Page 19

WA-3420 CATEGORIES OF THE PACKAGING OWNER'S RESPONSIBILITIES

The responsibilities of the Packaging Owner include the requirements of (a) through (o) below as applicable:

(a) assuming title to the transport packaging upon delivery by the Class TP Certificate Holder;

- (b) obtaining a Packaging Owner's Certificate of Accreditation (WA-3430);
- (c) documenting a Quality Assurance Program (WA-3471);
- (d) obtaining a written agreement with an Authorized Inspection agency (WA-3430 and WA-8130);
- (e) selecting a Class TP Certificate Holder to construct the containment system;
- (f) establishing the Code Editions, Addenda, and Code Cases to be used in the Construction Specification, and determining that they are consistent with the Design Documents and are acceptable to the regulatory and enforcement authorities (WA-1140);
- (g) verifying that the Code Editions, Addenda, and Code Cases used in the construction of the completed containment system are consistent with the Construction Specification, and Design Documents;
- (h) initiating construction through the issuance of a Construction Specification for the containment system;
- (i) providing the Class TP Certificate Holder with the Design Documents and other applicable documents identified in the Construction Specification (WA-3452);
- (j) making available to the Inspector the documents specified by this Division and those requested by the Inspector to ensure compliance with Code requirements (WA-5242);
- (k) verifying that the Class TP Certificate Holder has prepared, certified and filed the Construction Report;
- (l) reviewing the Construction Report and verifying that it is consistent with the Design Documents and Construction Specification (WA-3460);
- (m) verifying that the Class TP Certificate Holder has prepared and filed the Data Report Form;
- (n) obtaining the Design Owner's approval and appropriate certification for any change to a Design Document after construction has begun;
- (o) performing other duties as assigned to the Packaging Owner throughout this Division.

WA-3430 PACKAGING OWNER'S CERTIFICATE OF ACCREDITATION

The Packaging Owner shall obtain a Packaging Owner's Certificate of Accreditation from the Society prior to the issuance of a Construction Specification. The information to be supplied by the Packaging Owner when making application is given in forms issued by the Society. A written agreement with an Authorized Inspection Agency (WA-8130) is required prior to the application.

WA-3450 PROVISION OF CONSTRUCTION SPECIFICATION

WA-3451 Provision and Correlation

It is the responsibility of the Packaging Owner to prepare, certify, and issue the Construction Specification for the containment system. The Packaging Owner shall be responsible for the proper correlation of all Data Reports for valves, piping systems, and parts that form part of the containment system. Separate Construction Specifications are not required for parts or piping subassemblies when they are included in the Construction Specification of a containment system for a transport packaging (WA-1210).

WA-3452 Contents of Construction Specifications

The Construction Specifications shall be based upon the Design Specifications and associated Design Drawings, and shall contain sufficient detail to provide a complete basis for construction in accordance with this Division. Such requirements shall not result in construction which fails to conform with the Design Specification, Design Documents and the rules of this Division.

WA-3455 Certification of the Construction Specification

The Construction Specification shall be certified to be correct and complete and to be in compliance with the requirements of WA-3450 by one or more Registered Professional Engineers, competent in the applicable field of construction and related transport packaging requirements and qualified in accordance with the requirements of ANSI/ASME N626.3. Such Registered Professional Engineers are not required to be independent of the organization preparing the Construction Specification.

WA-3456 Filing of Construction Specifications

The Construction Specifications in their entirety shall become the principal document governing construction

Page 20

of items. A copy of the Construction Specification shall be made available to the Inspector at the manufacturing site before fabrication begins.

WA-3460 REVIEW OF THE CONSTRUCTION REPORT

(a) The Construction Report which the Class TP Certificate Holder provides shall be reviewed by the Packaging Owner to determine that all requirements described in the Construction Specification and this Division have been met.

(b) Documentation shall be provided by the Packaging Owner to indicate that the review required by (a) above has been completed.

(c) A copy of the documentation required by (b) above shall be attached to, and become part of the Construction Report.

(d) A copy of the completed Construction Report, including the documentation required by (b) above shall be made available to the Class TP Certificate Holder's Authorized Nuclear Inspector before the containment system is stamped.

WA-3470 RESPONSIBILITY FOR QUALITY ASSURANCE

WA-3471 Scope of Responsibilities

The Packaging Owner shall document its Quality Assurance Program (WA-4134) and shall file with the Authorized Inspection Agency (WA-5121) copies of the Quality Assurance Manual. The Packaging Owner shall keep a copy on file available to the Inspector (WA-5122).

WA-3480 PACKAGING OWNER'S RESPONSIBILITY FOR RECORDS

The Packaging Owner shall be responsible for designating the records to be maintained by the Class TP Certificate Holder (WA-4134.17). The Packaging Owner shall be responsible for ensuring that records required by this Division are maintained (WA-4134.17).

WA-3500 DEFINITION AND RESPONSIBILITIES OF A CLASS TP CERTIFICATE HOLDER - DIVISION 3

WA-3510 DEFINITION OF A CLASS TP CERTIFICATE HOLDER

The term Class TP Certificate Holder, as used in this division, is defined in WA-3114.

WA-3520 CATEGORIES OF THE CLASS TP CERTIFICATE HOLDER'S RESPONSIBILITIES

The responsibilities of the Class TP Certificate Holder include the requirements of (a) through (o) below as applicable:

(a) constructing a containment system for a transport packaging in accordance with the Construction Specification and the requirements of this Division;

(b) preparing and certifying the Construction Documents (WA-3550) in accordance with the requirements of this Division;

(c) obtaining an N-type Certificate of Authorization (WA-3530);

- (d) providing the Packaging Owner with information necessary to reconcile Construction with Design Documents;
 - (e) provision of Construction Report to Packaging Owner for review, documentation of review, and filing (WA-3562);
 - (f) qualification of Material Organizations, and suppliers of subcontracted services (WA-3581);
 - (g) documenting a Quality Assurance Program (WA-3582);
 - (h) filing the Quality Assurance Manual (WA-3583);
 - (i) prepare and file the proper Data Reports forms (WA-3590);
 - (j) obtaining an agreement with an Authorized Inspection Agency (WA-8130);
 - (k) making available to the Inspector the documents specified by this Division and those requested by him to assure compliance with Code requirements;
 - (l) review of Certified Material Test Reports and Certificates of Compliance for materials (WA-1220);
 - (m) preparation, accumulation, control, and protection of required records while in his custody (WA-4134.17);
 - (n) documentation of review and approval of material as permitted by WA-1140(d).
 - (o) performing other duties as assigned to the Class TP Certificate Holder throughout this Division.
-

Page 21

WA-3530 CLASS TP CERTIFICATE OF AUTHORIZATION

A Class TP Certificate of Authorization (WA-8100) shall be obtained for the construction of any item intended to be in compliance with the requirements of this Division and to be stamped with a Class TP Code Symbol.

WA-3540 COMPLIANCE WITH THIS DIVISION

The Class TP Certificate Holder has the responsibility for assuring that the construction of the item meets the Construction Specification and complies with the construction requirements of this Division, furnishing a Construction Report, and completing the appropriate Data Report Form.

WA-3550 REQUIREMENTS FOR CONSTRUCTION DOCUMENTS

WA-3551 Construction Procedures

Procedures describing methods of construction to satisfy the Construction Specification shall be provided. Such procedures shall give sufficient detailed information about the methods of construction to enable those reviewing the procedures to determine whether the requirements of the Construction Specification will be satisfied. Construction Procedures will include test procedures to be performed by the Class TP Certificate Holder that are needed to establish conformance with the Construction Specification and this Division.

WA-3552 Shop Drawings

The Class TP Certificate Holder shall provide Shop Drawings describing construction details, physical dimensions, and any significant engineering features needed to establish conformance with the Construction Specification and this Division.

WA-3553 Material Documentation

The Class TP Certificate Holder shall assemble records to verify that materials comply with the requirements of the Construction Specification and this Division.

WA-3560 CONSTRUCTION REPORT

WA-3561 Content of Construction Report

The Class TP Certificate Holder shall provide a Construction Report which confirms and verifies that the completed containment system complies with the requirements of the Construction Specification and this Division. The Construction Report shall include the following:

- (a) a list of all Construction Documents which were used for the construction of the containment system, including as-built drawings, showing the revision used for construction and date;
- (b) a summary of deviations (nonconformances) giving a brief description of the nature of the deviations (nonconformances) and the corrective actions and the date when the corrective actions were taken;
- (c) a complete, detailed record of all containment system acceptance testing;
- (d) quality assurance records (WA-4134.17).

WA-3562 Submittal of Construction Report to Packaging Owner for Review

The Class TP Certificate Holder shall submit to the Packaging Owner a copy of the completed Construction Report for the containment system for review and documentation of the review to the extent required by WA-3460.

WA-3570 MODIFICATION OF CONSTRUCTION DOCUMENTS AND RECONCILIATION WITH DESIGN REPORT

If the as-constructed condition of a containment system is not in accordance with the Construction Specification, that containment system may not be Code symbol stamped unless the Design Specification, the Design Report, and the Construction Report have been supplemented by the organization responsible for those documents to reconcile the differences. Any supplement to these documents shall receive the same approvals and certifications as the original document.

WA-3580 RESPONSIBILITY FOR QUALITY ASSURANCE

WA-3581 Scope of Responsibilities

- (a) The Class TP Certificate Holder shall be responsible for surveying, qualifying, and auditing suppliers of

Page 22

subcontracted services (WA-3122), including nondestructive examination contractors, and Material Organizations or Material Organizations holding Quality System Certificates (Materials), and Certificate Holders whose scope includes supply or manufacture supply of materials, need not be surveyed nor audited for work or material covered by the scope of their Certificate. Subcontractors holding an appropriate Certificate need not be surveyed nor audited for work within the scope of the subcontractor's Certificate.

(b) A Class TP Certificate Holder may qualify vendors of subcontracted services (WA-3122) other than those requiring a Certificate, such as Material Organizations, for another Certificate Holder doing work for that Class TP Certificate Holder. The qualification documentation shall be supplied to the other Certificate Holder prior to their use of the subcontracted service, or Material Organization.

WA-3582 Documentation of Quality Assurance Program

The Class TP Certificate Holder shall be responsible for documenting its Quality Assurance Program (WA-4134).

WA-3583 Filing of Quality Assurance Manual

The Class TP Certificate Holder shall file with the Authorized Inspection Agency (WA-5121) copies of the Quality Assurance Manual. The Class TP Certificate Holder shall keep a copy on file available to the Inspector (WA-5122).

WA-3590 DATA REPORT

The Class TP Certificate Holder shall certify compliance with this Division by signing the appropriate Data Report

The Class TP Certificate Holder shall certify compliance with this Division by signing the appropriate Data Report including stamping (WA-8000).

WA-3800 METALLIC MATERIAL QUALITY SYSTEM PROGRAM

WA-3810 EXCLUSIONS

Material falling within the small products exclusion of WB-2610 or material which is allowed by this Section to be furnished with a Certificate of Compliance, is exempted from the requirements of WA-3800, except:

- (a) Certified Material Test Reports or Certificates of Compliance shall meet the requirements of WA-3862.1.
- (b) For construction of components meeting the requirements of this Division, material identification and marking shall meet the requirements of WA-3856.3.

WA-3820 ACCREDITATION OR QUALIFICATION OF MATERIAL ORGANIZATIONS

- (a) A Material Organization shall be accredited by obtaining a Quality System Certificate issued by the Society verifying the adequacy of the Material Organization's Quality System Program.
- (b) Alternatively, the Certificate Holder (WA-3461, WA-3561, WA-3661, or WA-3761) or, when included in its scope of activities, the accredited Material Organization [WA-3820(a)] may qualify Material Organizations not accredited by the Society by evaluation of the organization's Quality System Program in accordance with the requirements of WA-3842.
- (c) A Certificate Holder may furnish material when stated in the scope of its Certificate. In this case, a Quality System Certificate is not required, nor is the user of the material required to survey, qualify, or audit such a Certificate Holder.

WA-3830 RESPONSIBILITIES OF MATERIAL ORGANIZATIONS

The Material Organization shall be responsible for establishing, documenting, implementing, and maintaining a Quality System Program in accordance with the requirements of WA-3850, and as applicable to its scope of activities:

- (a) establishing and maintaining measures for the traceability of material or source material while under its control (WA-3856);
- (b) controlling quality during manufacture, including control of testing, examination, repair, and treatment of the material or source material (WA-3857, WA-3858);
- (c) evaluating, qualifying, and auditing Material Organizations (WA-3842), as provided by WA-3820(b), except when the party holds a Quality System Certificate which covers the operations performed;
- (d) approving and controlling operations performed by suppliers of source material and subcontracted services (WA-3855);
- (e) preparing Certified Material Test Reports and Certificates of Compliance (WA-3860).

Page 23

WA-3840 EVALUATION OF THE PROGRAM

WA-3841 Evaluation by the Society

(a) The Society, when requested by the applicant on forms issued by the Society, will arrange for a survey of the Material Organization's Quality System Program for the scope of activities on the application. The Program will be evaluated on the basis of its compliance with the applicable material requirements of this Division and the requirements of this Division. The Quality System Certificate, which is issued for a three year period, will describe and specify the scope and limits of work for which the accredited Material Organization is qualified and will be subject to a planned audit program by the Society. Not later than six months prior to the expiration of the Certificate, the accredited Material Organization shall apply for a renewal evaluation and for issuance of a new Certificate.

- (b) The applicant shall supply all information required by forms provided by the Society.
- (c)

(d) A controlled copy of the accredited Material Organization's Quality System Manual shall be filed with the Society. The Manual shall be the Society's guide for surveying and auditing the accredited Material Organization's continued compliance with the accepted Quality System Program.

(e) The accredited Material Organization shall make available for on-site review by the Society any procedures, process sheets, or drawings as are necessary to understand the Program. Detailed technical procedures will not be approved by the Society. The accredited Material Organization shall keep a controlled copy of the Manual on file and in a place and manner readily available to the Society's audit team.

(f) The accredited Material Organization shall obtain the Society's review and acceptance of proposed modifications to the Quality System Manual prior to implementation.

(g) When the applicant requests that the scope of the Quality System Certificate include qualification of non-accredited Material Organizations (WA-3842), this activity shall be included in the Manual, and will be reviewed by the Society.

(h) When the applicant requests that the scope of the Quality System Certificate include implementation of WA-3855.5, Utilization of Unqualified Source Material, this activity shall be included in the Manual and will be reviewed by the Society.

(i) When the applicant requests that the scope of the Quality System Certificate include approval and control of suppliers (WA-3855.3), this activity shall be included in the Manual and will be reviewed by the Society.

WA-3842 Evaluation by Parties Other Than the Society

WA-3842.1 Qualification of Material Organizations.

The qualification of Material Organizations by parties other than the Society shall be limited to the furnishing of source material, material, or subcontracted services to the accredited Material Organization or Certificate Holder performing the evaluation, or their designee.

WA-3842.2 Evaluation of the Qualified Material Organization's Program by Accredited Material Organizations or Certificate Holders.

Evaluation of a Material Organization's Quality System Program by parties other than the Society, as provided by WA-3820(b), shall be performed in accordance with the requirements of WA-3842.2(a) through (h) below.

(a) The Quality System Program shall be surveyed, accepted, and audited by the party performing the evaluation on the basis of its compliance with the applicable material requirements of this Division and the requirements of WA-3850.

(b) The Quality System Manual (WA-3853.1) shall be the party's guide for surveying and auditing the qualified Material Organization's continued compliance with the accepted Quality System Program.

(c) The qualified Material Organization shall make available for on-site review by the party performing the evaluation any procedures, process sheets, or drawings as are necessary to understand the Program. The qualified Material Organization shall keep a controlled copy of the Manual on file and in a place and manner readily available to the party performing the audit.

(d) The qualified Material Organization shall notify purchasers of material, source material, or subcontracted services accepting its Program of proposed modifications to its Quality System Manual. The party accepting the Program shall evaluate and accept such modifications prior to the implementation of the modifications on purchased materials or services.

(e) When the qualified Material Organization's scope of activities includes utilization of unqualified source material (WA-3855.5), this activity shall be included in the Quality System Manual, and shall be reviewed by the party accepting the Program.

(f) When the qualified Material Organization's scope of activities includes approval and control of suppliers (WA-3855.3), this activity shall be included in the Quality System Manual, and shall be reviewed by the

party accepting the Program. During surveys or audits of qualified Material Organizations, the party performing the evaluation shall review objective evidence that the qualified Material Organization's control of suppliers is adequate to assure compliance with the applicable material requirements of this Division.

(g) Audits by parties performing evaluations of qualified Material Organizations shall meet the following requirements:

(1) The party performing the evaluation shall include audit frequency in their Manual.

(2) Audit frequencies shall be commensurate with the schedule of production or procurement, but shall be conducted at least once triennially during the interval in which materials are controlled or services are performed by the Material Organization being evaluated.

(3) Audits shall meet the requirements of WA-3859.1(a) through (c).

(h) The party performing the evaluation shall supplement triennial audits with annual audits or performance assessments documenting the effectiveness of the qualified Material Organization's Quality System Program. Performance assessments shall meet the following requirements:

(1) Assessment frequencies shall be commensurate with the schedule of production or procurement, but shall be conducted at least once annually during the interval in which materials or source materials are controlled, or services are supplied by the Material Organization being evaluated.

(2) Assessments shall include a documented review of the qualified Material Organization's history of conditions adverse to quality, nonconformances, and corrective actions.

(3) Assessments shall include a documented review of periodic testing performed since the last assessment to demonstrate conformance of sample materials to selected requirements of the material specification. Such testing shall be conducted during the period since the last assessment by the party performing the evaluation.

WA-3850 QUALITY SYSTEM PROGRAM REQUIREMENTS

WA-3851 Responsibility and Organization

WA-3851.1 General

(a) The Material Organization shall establish a Quality System Program for the control of quality during manufacture or during other work it proposes to perform, and for the traceability of material or source material under its control. The Program shall be planned, documented, implemented, and maintained in accordance with the requirements of WA-3850.

(b) The establishment of the Program shall include consideration of the technical aspects and provide for planning and accomplishment of activities affecting quality. The Program shall provide for any special controls, processes, test equipment, tools, and skills to attain the required quality and for verification of quality.

WA-3851.2 Scope and Applicability

(a) The Quality System Manual shall define the specific activities included in the scope of the work the Material Organization proposes to perform, including any combination of:

(1) Operations performed during the melting and heat analysis, affecting the mechanical properties, conversion from one product form into another product form including applicable dimensional requirements, and certification to the applicable material specification.

(2) Testing, examination, repair, or treatments required by the material specification or the specific applicable material requirements of this Section and certification of the results of such tests, examinations, repairs, or treatments.

(3) Receipt, identification, verification, handling, storage, and shipment of material or source material.

(4) Qualification of Material Organizations permitted by WA-3820(b).

(5) Approval and control of suppliers of source material or subcontracted services (WA-3855.3).

(6) Utilization of unqualified source material (WA-3855.5).

(b) The Program shall include measures to comply with all requirements of this Division, to the extent necessary to assure compliance with the requirements of this Division.

WA-3851.3 Organization

(a) The organizational structure for executing the Program may take various forms, provided the persons and organizations assigned the quality assurance functions have the required authority and organizational freedom.

(b) Persons or organizations responsible for defining and measuring the overall effectiveness of the Program shall:

(1) be designated;

(2) be sufficiently independent from the pressures of production;

(3) have direct access to responsible management at a level where appropriate action can be initiated;

(4) report regularly on the effectiveness of the Program.

Page 25

(c) The organizational structure, functional responsibilities, levels of authority, and lines of communication for activities affecting quality shall be documented. Persons or organizations responsible for assuring that an appropriate Quality System Program has been established and verifying that activities affecting quality have been correctly performed shall have sufficient authority, access to work areas, and organizational freedom to:

(1) identify quality problems;

(2) initiate, recommend, or provide solutions to quality problems through designated channels;

(3) verify implementation of solutions;

(4) assure that further processing, delivery, or use is controlled until proper disposition of a nonconformance, deficiency, or unsatisfactory condition has occurred.

(d) Individuals or groups assigned the responsibility of checking, auditing, or otherwise verifying that production and quality control activities have been correctly performed, shall be independent of the individual or group directly responsible for performing the specific activity. Such persons shall not report directly to the supervisor with immediate responsibility for the work being verified.

(e) Management shall regularly review the status and adequacy of the Program.

WA-3852 Personnel

WA-3852.1 Indoctrination, Training, and Qualification of Personnel

(a) Measures shall be established to assure that all personnel performing or managing activities affecting quality are indoctrinated and trained. The assignment of personnel shall be at the discretion of the organization's management. Indoctrination and training measures shall reflect the following requirements:

(1) Personnel to be indoctrinated or trained shall be identified.

(2) The extent of indoctrination and training shall be commensurate with the scope, complexity, and nature of the activity as well as the education, experience, and proficiency of the person.

(3) Personnel shall be indoctrinated in the general criteria, applicable codes, standards, company procedures, Quality System Program requirements, job responsibilities and authority as they relate to a particular function.

(4) Training shall be provided, as needed, to achieve initial proficiency, maintain proficiency, and adapt to changes in technology, methods, and job responsibilities.

(b) All nondestructive examination personnel shall be qualified in accordance with para. WB-5521 of the applicable Subsection.

(c) Personnel who lead audits shall be qualified on the basis of education, experience, training, audit participation, and examination in accordance with the organization's Quality System Program.

WA-3852.2 Personnel Records

(a) Records shall be maintained of the implementation of indoctrination and training of personnel. Records of indoctrination and training may take the form of attendance sheets, training logs, or personnel training records.

(b) Qualification records of all nondestructive examination personnel shall be documented and maintained.

(c) Qualification records of personnel who lead audits shall be documented and maintained and shall include education, experience, audit training and examination, and audit participation used as the basis of qualification.

WA-3853 Program Documentation

WA-3853.1 Quality System Manual

(a) The Quality System Program shall be described and summarized in a Quality System Manual which shall be a major basis for demonstration of compliance with the rules of this Division.

(b) The Program documented in the Manual shall be implemented by written procedures which are maintained either separately or in the Quality System Manual.

(c) Detailed technical procedures and processes, such as those for nondestructive examination, are not considered part of the Manual; however, the controls of such procedures and processes shall be covered by the Manual.

WA-3853.2 Procedures, Instructions, and Drawings

(a) Activities affecting quality shall be prescribed by and performed in accordance with documented instructions, procedures, or drawings of a type appropriate to the circumstances.

(b) These documents shall include or reference appropriate acceptance criteria for determining that the prescribed activities have been satisfactorily completed.

WA-3853.3 Document Control.

The preparation, issue, and change of documents that specify quality requirements or prescribe activities affecting quality, such as Quality System Program Manuals, purchase specifications, instructions, procedures, and drawings shall be controlled to assure that the correct documents are being used at the location where the activity is

Page 26

performed. Such documents, including changes thereto, shall be reviewed for adequacy and approved for release by authorized personnel.

WA-3853.4 Quality Assurance Records.

Records that furnish documentary evidence of quality shall be specified, prepared, controlled, and maintained. Records shall be legible, identifiable, and retrievable. Records shall be protected against damage, deterioration, or loss. Requirements and responsibilities for record transmittal, distribution, retention, maintenance, and disposition shall be established and documented.

WA-3853.5 Records of Examinations and Tests.

All characteristics required to be reported by the material specification and this Division shall be verified and the results recorded. Records shall be traceable to the document and revision to which an inspection, examination, or test was performed.

WA-3855 Control of Purchased Materials, Source Materials, and Services

WA-3855.1 General

(a) Measures shall be established to assure that all purchased material, source material, and subcontracted services conform to the requirements of this Division.

(b) Welding material used in the repair of material or source material shall be controlled in accordance with this Division.

(c) These measures shall be designed to prevent the use of incorrect or defective material or source material, or materials which have not received the required examinations or tests.

WA-3855.2 Sources of Material, Source Material, and Services

(a) Material shall be furnished by a Material Organization [WA-3820(a) or WA-3820(b)], or by a Certificate Holder [WA-3820(c)].

(b) Except as provided in WA-3855.5, source material shall be furnished by a Material Organization, by an approved supplier (WA-3855.3), or by a Certificate Holder.

(c) Services including performance and certification of operations, processes, the results of tests, examinations, repairs, or treatments required by the material specification or by this Division shall be furnished by a Material Organization, by an approved supplier, or by a Certificate Holder.

WA-3855.3 Approval and Control of Suppliers of Source Material and Services

(a) The Material Organization or Certificate Holder shall be responsible for the approval of and control of activities performed by suppliers of source materials and subcontracted services. Such control shall provide for source evaluation and selection, evaluation of objective evidence of quality, audit, and examination of items and services upon delivery, in accordance with requirements documented in the Material Organization's or Certificate Holder's Program.

(b) The Material Organization or Certificate Holder shall be responsible for establishing and verifying that the supplier's controls applicable to the activities performed are adequate by:

(1) surveying and auditing the supplier's established quality system which is consistent with the requirements of this Division, or

(2) having the supplier perform the activities in accordance with controls established by the Material Organization's or Certificate Holder's Program.

(c) The Material Organization or Certificate Holder shall be responsible for assuring that all material and activities conform to all applicable requirements of this Division.

WA-3855.4 Procurement Document Control

(a) Procurement documents shall include requirements necessary to assure compliance with the requirements of this Division.

(b) Except as provided in WA-3855.5, procurement documents shall require material, source material, or subcontracted services to be furnished in accordance with the applicable requirements of this Division.

(c) Procurement documents shall require approved suppliers to reference the accepted quality system or controls established by the Material Organization or Certificate Holder on documentation that accompanies the source material or services furnished.

(d) Procurement documents that specify quality requirements or prescribe activities affecting quality shall be reviewed for adequacy and approved for release by authorized personnel.

WA-3855.5 Utilization of Unqualified Source Material

(a) As an alternative to WA-3855.2(b), when included in its scope of activities as permitted by the provisions of this Division, a Material Organization may accept certification of the requirements of the material specification which must be performed during the melting, heat analysis, and heat treatment of the material, and may use or furnish unqualified source material, provided the requirements of WA-3855.5(a)(1) through (4) below are met:

(1) No welding with filler metal has been performed on the unqualified source material.

Page 27

(2) The Material Organization performs or subcontracts a product analysis to verify the chemical composition of each piece of unqualified source material.

(3) The Material Organization performs or subcontracts all other requirements of the material specification on each piece of unqualified source material. Where Certificates of Compliance [WA-3862.1(g)] are acceptable, testing of each piece is not required. Alternatively, the Material Organization may perform or subcontract all other requirements of the material specification on each heat and lot of unqualified source material provided:

(a) A Certified Material Test Report is provided with the unqualified source material.

(b) The unqualified source material is traceable to the Certified Material Test Report.

(c) Procurement documents require that suppliers of unqualified source material establish written procedures for identifying source materials in a manner that provides traceability to the Certified Material Test Report.

(d) The Material Organization reviews and accepts the supplier's identification and traceability procedures and verifies compliance with the procedures at a frequency commensurate with the schedule of production or procurement, but at least once triennially.

(e) Upon receipt, the Material Organization shall verify by review of objective evidence, that the requirements of the procurement document have been met.

(4) The provisions of (a)(1) through (a)(3) above are performed in accordance with the Material Organization's Quality System Program.

(b) The provisions of (a)(1) through (a)(3) above may be performed by the Certificate Holder in accordance with his Quality Assurance Program.

WA-3856 Identification, Marking, and Material Control

WA-3856.1 General

(a) Control shall be established to assure that only correct and accepted material or source material is used. Identification shall be maintained on these materials or on documents traceable to these materials, or in a manner which assures that the identification is established and maintained.

(b) Measures shall be established for controlling and identifying material or source material, including that which is partially processed, throughout the manufacturing process, during the performance of tests, examinations, repairs, and treatments, and during receipt, storage, handling, and shipment.

(c) Identification marking shall be transferred to all pieces when material or source material is divided.

WA-3856.2 Marking Method.

Materials and source materials shall be marked by any method acceptable to the purchaser which will not result in harmful contamination or sharp discontinuities and will identify these materials in accordance with the material specification.

WA-3856.3 Identification of Completed Material

(a) The identification of completed material shall consist of marking the material with the applicable specification and

grade of the material, the heat number or heat code of the material, and any additional marking required by this Division to facilitate traceability of the material to reports of the results of all tests and examinations performed on the material.

(b) For those materials where Certificates of Compliance [WA-3862.1(g)] are allowed, heat-number identification need not be indicated on the material or the Certificate.

(c) A marking symbol or code may be used which identifies the material, provided such code or symbol is explained in the Certified Material Test Report (WA-3862.1) or Certificate of Compliance [WA-3862.1(g)], as applicable.

(d) All requirements of the material specification shall be met except where specifically exempted or superseded by a provision of this Division. When special requirements or provisions of this Division conflict with the requirements of the material specification, the material specification and grade number shall be followed with an asterisk (*) to indicate that the material specification has been modified as shown on the material certification.

(e) For nonferrous materials manufactured in accordance with material specifications which do not provide for heat identification, the material shall be marked with a symbol or code that identifies the lot, as defined in the material specification, with the Certified Material Test Report.

(f) Except as required by the material specification, bolts and nuts 1 in. (25 mm) nominal diameter and smaller and other products where the largest space available for marking is less than 1 in. (25 mm) in any one direction need not be individually marked, provided they are packed in packages or containers which shall be clearly identified by legible marking to ensure positive identification of the material. The markings on the containers shall identify the material with the Certificate of Compliance [WA-3862.1(g)] or Certified Material Test Report (WA-3862.1), as applicable.

Page 28

WA-3856.4 Welding and Brazing Materials Identification.

Welding and brazing materials shall be clearly identified by legible marking on the package or container to ensure positive identification of the material. The marking shall include the heat or lot number as applicable, a control marking code which identifies the material with the Certified Material Test Report (WA-3862.1), and other information such as specification, grade and classification number, Material Organization's name, and trade designation.

WA-3857 Process Control

WA-3857.1 General.

Processes affecting quality of materials, source materials, or services shall be controlled. Special processes that control or verify quality, such as those used in welding, heat treating, or nondestructive examination, shall be performed by qualified personnel using qualified procedures in accordance with specific requirements.

WA-3857.2 Manufacturing Process Control.

Operations shall be performed under a controlled system such as process sheets, shop procedures, checklists, travellers, or equivalent procedures. Measures shall be established to ensure that processes, including heat treatment, are controlled in accordance with the material specification and the rules of this Division.

WA-3857.3 Welding.

When welding is required in the repair of material or source material, it shall be performed in accordance with procedures and by welders or welding operators qualified in accordance with this Division and Section IX. The qualification of procedures and welders or welding operators shall be documented.

WA-3857.4 Handling, Storage, Shipping, and Preservation.

Instructions shall be established for handling, storage, shipping, and preservation of material or source material to prevent damage or deterioration.

WA-3858 Control of Examinations, Tests, and Nonconforming Material

WA-3858.1 Inspection, Examination, and Test Control

(a) Inspections, examinations, and tests shall be established to assure conformance with the requirements of the material specification and this Division.

(b) Inspections or examinations required to verify conformance of material, source material, or an activity to specified requirements shall be planned. Characteristics to be inspected or examined, and inspection or examination methods to be employed, shall be specified. Inspection or examination results shall be documented.

(c) Tests required to verify conformance to specified requirements shall be planned. Characteristics to be tested and test methods to be employed shall be specified. Test results shall be documented and their conformance with acceptance criteria shall be evaluated.

WA-3858.2 Control of Measuring and Test Equipment

(a) Procedures shall be in effect to assure that tools, gages, instruments, and other measuring and testing devices used to verify compliance with the material specification and this Division are calibrated and properly adjusted at specific periods or use intervals to maintain accuracy within necessary limits. Periodic checks on equipment may be performed to determine that calibration is maintained.

(b) Calibration shall be against certified equipment having known valid relationships and documented traceability to nationally recognized standards, where such standards exist. If no known nationally recognized standards exist, the basis for calibration shall be documented.

(c) Control measures shall include provisions for measuring and test equipment identification and for determining calibration status by equipment marking or on records traceable to the equipment.

WA-3858.3 Discrepancies in Measuring or Testing Equipment

(a) When discrepancies in excess of tolerances for measuring or testing equipment are found at calibration, appropriate corrective action shall be taken, and material measured or tested since the previous calibration shall be reviewed to determine that all applicable requirements have been met.

(b) When periodic checks on equipment are performed to determine that calibration is maintained, potential material or source material discrepancies need only be resolved to the previous check, provided:

- (1) the methods used and frequency of periodic checking are described in calibration procedures; and
- (2) the calibration discrepancy was found by periodic check.

WA-3858.4 Inspection and Test Status.

Measures shall be established so that the status and results of any required inspections, examinations, or tests can be determined at any time. Status shall be maintained through indicators such as physical location and tags, marking, shop travellers, stamps, inspection records, or other suitable means. The authority for application and removal of such indicators shall be specified.

Page 29

WA-3858.5 Control of Nonconforming Material

(a) Adequate control measures shall be established to prevent the use of material that does not conform to the requirements of the material specification and this Division.

(b) Material or source material with nonconformances shall be identified, segregated when practical, and reviewed for acceptance, rejection, or repair in accordance with documented procedures. The responsibility and authority for the disposition of nonconformances in these materials shall be defined.

(c) Repaired material or source material shall be reexamined in accordance with applicable procedures.

(d) Measures which control further processing of nonconforming or defective material or source material, pending a decision on its disposition, shall be established and maintained. These control measures shall extend to notification of other affected organizations, as appropriate.

WA-3859 Audits and Corrective Action

WA-3859.1 Audits

(a) Audits shall be performed in accordance with written procedures or checklists by personnel not having direct responsibility in the areas being audited.

(b) Audit results shall be documented by auditing personnel for review by management having responsibility in the area being audited.

(c) Procedures shall include provisions for documentation of corrective action taken in response to deficiencies. Follow-up action, including re-audit of deficient areas where indicated, shall be taken to verify implementation of such corrective actions.

(d) In addition to audits of Material Organizations and suppliers, a comprehensive system of planned and periodic internal audits shall be carried out to assure compliance with all aspects of the Quality System Program and to determine the effectiveness of the Program.

(e) Internal audits shall be performed in accordance with the requirements of (a) through (c) above.

WA-3859.2 Corrective Action

(a) Measures shall be established to assure that conditions adverse to quality such as failures, malfunctions, deviations, defective material and equipment, nonconformances, and quality system deficiencies, are promptly identified and reported to appropriate levels of management. The measures shall also assure that the cause of conditions adverse to established quality levels be determined and corrected.

(b) The identification of significant or recurring conditions adverse to quality, the cause of condition, and the corrective action taken shall be documented and reported to appropriate levels of management.

(c) These requirements shall also extend to the performance of the approved supplier's corrective action measures.

WA-3860 CERTIFICATION REQUIREMENTS

WA-3861 Certification Requirements for Material Organizations

(a) The Material Organization whose scope of activities includes WA-3830 shall provide a Certified Material Test Report or Certificate of Compliance, as applicable (WA-3862), for the material.

(1) The certification affirms that contents of the report are correct and accurate and that all test results and operations performed by the Material Organization or its subcontractors are in compliance with the material specification and the specific applicable material requirements of this Division.

(2) Chemical analyses, tests, examinations, and heat treatments required by the material specification that were not performed shall be listed on the Certified Material Test Report or Certificate of Compliance, as applicable, or may be listed on an identified attachment.

(3) When the Material Organization's scope of activities includes product form conversion, the Material Organization shall also certify that the material conforms to the applicable dimensional requirements.

(b) The Material Organization shall transmit all certifications received from other Material Organizations or approved suppliers in accordance with (a) above, to the purchaser at time of shipment.

(c) The Certificate Holder shall complete all operations not completed by the Material Organization and shall provide a Certified Material Test Report for all operations performed by him or his approved suppliers. The Certificate Holder shall certify that the contents of the report are correct and accurate and that all test results and operations performed by the

Certificate Holder or his approved suppliers are in compliance with the requirements of the material specification and this Division. Alternatively, the Certificate Holder shall provide a Certified Material Test Report for the operations it performed and at least one Certified Material Test Report from each of its approved suppliers for the operations they performed.

WA-3862 Certification of Material

WA-3862.1 Material Certification

(a) The Certified Material Test Report shall include the actual results of all required chemical analyses, tests, and examinations.

(b) When required chemical analyses (including melting mill heat analysis), heat treatment, tests, examinations, or repairs are subcontracted, the approved supplier's certification for the operations performed shall be furnished as an identified attachment to the Certified Material Test Report.

(c) The Certified Material Test Report shall also include a report of all weld repairs performed on the material as required by this Division. Radiographic film required for the examination of material repair welds shall be included as a part of the Certified Material Test Report, except for those radiographs required for the testing of welding or brazing materials.

(d) When specific times or temperatures (or temperature ranges) of heat treatments are required by material specifications, they shall be reported. When specific times and temperatures (or temperature ranges) are not required by the material specification, a statement of the type of heat treated condition shall be reported. In any case, a statement of the minimum solution annealing temperature is adequate for austenitic stainless steels and high nickel alloys. Additionally, the times and temperatures of postweld heat treatments of weld repaired materials as required by the fabrication requirements of this Division shall be reported.

(e) Reporting of actual dimensions and visual examination results is neither required nor prohibited by this paragraph.

(f) Notarization of the Certified Material Test Report is not required.

(g) A Certificate of Compliance with the material specification, grade, class, and heat treated condition, as applicable, may be provided in lieu of a Certified Material Test Report for material NPS $\frac{3}{4}$ (DN 20) and less (pipe, fittings, flanges, materials for valves and tubes except heat exchanger tubes), bolting 1 in. (25 mm) and less, as applicable.

(h) Material identification shall be described in the Certified Material Test Report or Certificate of Compliance, as applicable. Heat or lot traceability to the Certificate of Compliance is not required.

WA-3862.2 Quality System Program Statement

(a) When the Material Organization holds a Quality System Certificate, the Material Organization's Quality System Certificate number and expiration date shall be shown on the Certified Material Test Report or Certificate of Compliance, as applicable, or on a certification included with the documentation that accompanies the material.

(b) When the Material Organization has been qualified by a party other than the Society, the revision and date of the applicable written Quality System Program shall be shown on the Certified Material Test Report or Certificate of Compliance, as applicable, or on a certification included with the documentation that accompanies the material.

(c) The inclusion of the Quality System Certificate number and expiration date or reference to revision and date of the applicable written Quality System Program shall be considered the Material Organization's certification that all activities have been performed in accordance with the applicable requirements of this Division.

July 1, 1998

American Society Of Mechanical Engineers
SEC III D3 WA-4000

ARTICLE WA-4000 QUALITY ASSURANCE

Page 31

Page 33

WA-4100 REQUIREMENTS

WA-4110 SCOPE AND APPLICABILITY

(a) This Article sets forth the requirements for planning, managing, and conducting Quality Assurance Programs for controlling the quality of activities performed under this Division and the rules governing the evaluation of such Programs prior to the issuance of Certificates for the design, construction, fabrication, and manufacture of Class TP items. The Quality Assurance requirements for Material Organizations are provided in WA-3800. Certificate Holders are advised to consult other regulations for quality assurance requirements governing activities beyond the scope of this Division.

(b) N-Type Certificate Holders shall comply with the Basic Requirements and Supplements of ASME NQA-1-1994, as modified and supplemented in WA-4134.

WA-4120 DEFINITIONS

(a) The definitions in WA-9000 shall apply.

(b) The terms and definitions of NQA-1-1994, Supplement S-1 shall apply except for those listed in (1) through (7) below. For the following terms, the definitions in WA-9000 shall apply:

- (1) *item*
- (2) *Owner*
- (3) *quality assurance*
- (4) *repair*
- (5) *rework*
- (6) *service*
- (7) *use-as-is*

WA-4130 ESTABLISHMENT AND IMPLEMENTATION

WA-4131 Material Organizations, Division 3

The requirements of WA-3800 apply.

WA-4134 Design Owners, Class TP Certificate Holders, and Packaging Owners

WA-4134.1 Organization.

The provisions of NQA-1-1994, Basic Requirement 1 and Supplement 1S-1, shall apply.

WA-4134.2 Quality Assurance Program

(a) The provisions of NQA-1-1994, Basic Requirement 2 and Supplements 2S-1 and 2S-3, shall apply and the system used to meet these requirements shall be described in the Quality Assurance Manual. The Quality Assurance Manual shall also include a statement of policy and authority indicating management support. The specific responsibilities of the quality assurance organization of the Certificate Holder shall also include the review of written procedures and monitoring of the activities concerned with the Quality Assurance Program as covered in this Article.

(b) In lieu of Supplement 2S-2, the qualification of nondestructive examination personnel shall be as required by WB-5520.

(c) The controls used in the Quality Assurance Program shall be documented in the Quality Assurance Manual. The Program need not be in the same format or sequential arrangement as the requirements in this Article, as long as all applicable requirements of this Article have been covered. A copy, including all changes that are made, shall be made available to the Inspector. The Certificate Holder shall make available to the Inspector such drawings and process sheets as are necessary to make the Quality Assurance Program intelligible.

(d) The Certificate Holder shall be responsible for advising its Authorized Inspection Agency of any significant changes which are proposed to be made to the Quality Assurance Manual, and shall have acceptance of the Authorized Inspection Agency's Authorized Nuclear Inspector Supervisor before putting such changes into effect. The Certificate Holder shall be responsible for promptly notifying the Inspector of such accepted changes, including evidence of acceptance by the Authorized

Page 34

Inspection Agency, and for simultaneously reconciling copies of the Quality Assurance Manual.

WA-4134.3 Design Control

(a) The provisions of NQA-1-1994, Basic Requirement 3 and Supplement 3S-1, shall apply.

(b) Measures shall be established to ensure that applicable requirements of the Design Specifications and of this Division for items are correctly translated into specifications, drawings, procedures, and instructions.

(c) Design documents shall be verified for adequacy and compliance with the Design Specification and this Division.

WA-4134.4 Procurement Document Control.

The provisions of NQA-1-1994, Basic Requirement 4 and Supplement 4S-1, shall apply, except that procurement documents shall require Suppliers to provide a Quality Assurance Program consistent with the applicable requirements of this Division.

WA-4134.5 Instructions, Procedures, and Drawings.

The provisions of NQA-1-1994, Basic Requirement 5, shall apply.

WA-4134.6 Document Control.

The provisions of NQA-1-1994, Basic Requirement 6 and Supplement 6S-1, shall apply.

WA-4134.7 Control of Purchased Items and Services.

The provisions of NQA-1-1994, Basic Requirement 7 and Supplement 7S-1, shall apply, except that:

(a) Supplement 7S-1, 8.3 is not applicable to the procurement of Authorized Inspection Agency services as required in WA-8130;

(b) the decision to perform bid evaluation for materials to confirm conformance to procurement documents, required in 7S-1, 4.0, shall remain the responsibility of the Certificate Holder;

(c) changes, waivers, or deviations permitted by 7S-1, 8.2.1(b) shall not be acceptable if they do not meet the requirements of this Division;

(d) resolution of nonconformances identified in 7S-1, 8.2.1(c) shall be in conformance with the requirements of this Division; and

(e) documentary evidence that items conform to the requirements of this Division shall be available at the site before use. Requirements for documentary evidence are satisfied for material when the applicable rules of WA-3800 for material certification are met. For stamped items, the requirements are satisfied by a Data Report.

WA-4134.8 Identification and Control of Items

(a) The provisions of NQA-1-1994, Basic Requirement 8 and Supplement 8S-1, shall apply.

(b) Welding and brazing materials shall be controlled.

(c) All characteristics required to be reported by the material specifications and by this Division shall appear on checklists, and each such characteristic shall be examined by accepted procedures as required and the results recorded. Characteristics included on Certified Material Test Reports or Certificates of Compliance need not be duplicated in the checklists. Checklists shall provide for a record that the Certified Material Test Reports and Certificates of Compliance have been received, reviewed, and found acceptable. When the results of the examination or test procedure conducted by the Certificate Holder are necessary to show compliance with material specification or other requirements, the checklists shall show the required range of values. The checklists shall include spaces for: inclusion of document number and revision to which examination or tests were made; a signature, initials, or stamp; the date of the examination performed by the Certificate Holder's representative; an Authorized Nuclear Inspector's signature, initials, or stamp; and the date on which those activities were witnessed.

WA-4134.9 Control of Processes

(a) The provisions of NQA-1-1994, Basic Requirement 9 and Supplement 9S-1, shall apply.

(b) The Certificate Holder shall prepare instructions, procedures, drawings, checklists, travelers, or other appropriate documents, including the document numbers and revisions to which the process conforms, with space provided for reporting results of completion of specific operations at checkpoints of fabrication, manufacture, or installation. The documents shall include space for: a signature, initials, or stamp; the date that the activity was performed by the Certificate Holder's representative; the Authorized Nuclear Inspector's signature, initials, or stamp; and the date on which those activities were witnessed.

WA-4134.10 Inspection

(a) The provisions of NQA-1-1994, Basic Requirement 10 and Supplement 10S-1, shall apply, except for para. 2 and the requirements of Inservice Inspection.

(b) The Certificate Holder shall prepare process sheets, travelers, or checklists, including the document numbers and revision to which the examination or test is to be performed, with space provided for recording results of examinations and tests. The documents shall include space for: a signature, initials, or stamp; the date that the activity was performed by the Certificate Holder's representative; the Authorized Nuclear Inspector's signature, initials, or stamp; and the date on which those activities were witnessed. The examination checklist for construction of items shall be filled in

Page 35

and completed by the Certificate Holder who applies the appropriate Code Symbol Stamp to the item.

(c) Mandatory hold points at which witnessing is required by the Certificate Holder's representative or the Authorized Nuclear Inspector shall be indicated in the controlling documents (WA-4134.9). Work shall not proceed beyond mandatory hold points without the consent of the Certificate Holder's representative or the Authorized Nuclear Inspector, as appropriate.

WA-4134.11 Test Control.

The provisions of NQA-1-1994, Basic Requirement 11 and Supplement 11S-1, shall apply.

WA-4134.12 Control of Measuring and Test Equipment

(a) The provisions of NQA-1-1994, Basic Requirement 12 and Supplement 12S-1, shall apply.

(b) The Certificate Holder may perform periodic checks on equipment to determine that calibration is maintained. When periodic checking is used, discrepancies need only be resolved to the prior check, provided the discrepancy is discovered by the periodic check. The methods and frequency of periodic checking, when used, shall be included in the Certificate Holder's Quality Assurance Program.

WA-4134.13 Handling, Storage, and Shipping.

The provisions of NQA-1-1994, Basic Requirement 13 and Supplement 13S-1, shall apply.

WA-4134.14 Inspection and Test Status.

The provisions of NQA-1-1994, Basic Requirement 14, shall apply for inspections and tests, but not for operating status.

WA-4134.15 Control of Nonconforming Items.

The provisions of NQA-1-1994, Basic Requirement 15 and Supplement 15S-1, shall apply, except that the definition of *repair* given in this Division shall apply in lieu of *repair* and *rework* given in NQA-1-1994.

WA-4134.16 Corrective Action

- (a) The provisions of NQA-1-1994, Basic Requirement 16, shall apply.
- (b) The requirements shall also extend to the performance of the subcontractor's corrective action measures.

WA-4134.17 Quality Assurance Records

(a) *General.* The provisions of NQA-1-1994, Basic Requirement 17 and Supplement 17S-1, shall apply, except that the requirements for classification in 17S-1, 2.7, retention of records in 17S-1, 2.8, and facility in 17S-1, 4.4 are not applicable. Such records shall be classified and maintained as required by this Division.

(b) *Records Index.* The records shall be indexed. The records and the indices thereto shall be accessible to the Packaging Owner, or his designee, and Authorized Nuclear Inspector.

(c) *Reproduction of Radiographs.* Radiographs may be reproduced provided the following requirements are met:

- (1) the reproduction process shall be subject to the Packaging Owner's approval;
- (2) when radiographs are reproduced for either a Packaging Owner or Class TP Certificate Holder, the Quality Assurance Program of the Class TP Certificate Holder responsible for the reproduction process shall include a system for controlling and monitoring the accuracy of the process so that the image, when reproduced to its original size, will provide the same information retrieval capability as the original radiograph;
- (3) procedures shall contain applicable requirements pertaining to exposure, scanning, focusing, contrast, resolution, and distinguishing film artifacts that might appear as material discontinuities in the reproduced image.

(d) *Lifetime Records.* For Class TP, the records listed in Table WA-4134.17-1 shall be classified as lifetime records. The Design Owner and Packaging Owner shall be responsible for their retention for the life of the item as indicated in the Table.

(e) *Nonpermanent Records.* For Class TP, the records listed in Table WA-4134.17-2 shall be classified as nonpermanent records. The Design Owner and Packaging Owner shall be responsible for their retention for the period specified in Table WA-4134.17-2. In no case need nonpermanent records be retained for longer than 10 years after completion of applicable Code Data Report, CMTR, or Certificate of Compliance.

WA-4134.18 Audits

- (a) The provisions of NQA-1-1994, Basic Requirement 18 and Supplement 18S-1, shall apply.
 - (b) Results of audits shall be made available to the Authorized Nuclear Inspector.
 - (c) The audit frequency shall be specified in the Certificate Holder's Quality Assurance Manual. The Certificate Holder's audit frequency shall be commensurate with his schedule of activities and shall be such that each ongoing Code activity is audited at least once annually.
-

**TABLE WA-4134.17-1 [Note (1)]
LIFETIME QUALITY ASSURANCE RECORDS**

Record	Record
1. Index to lifetime records (WA-4134.17) [DO, PO] [Note (2)]	9. Final nondestructive examination reports; Final radiographs for the containment system [PO]
2. Code Data Reports (WA-8400) [PO]	10. Repair records when required by Code (WB-4130) [PO]
3. Design Specification (WA-3250) [DO, PO]	11. Weld procedures [PO]
4. Design Documents (WA-2550) [DO, PO]	12. Audit and survey reports (WA-4121 and WA-4134.18) [DO, PO]
5. As-built drawings (WA-3554) [PO]	13. Process sheets, travelers, or checklists (WA-4134.10) [PO]
6. Certified Material Test Reports (CMTR) and documentation providing traceability to location used, if required (WB-4122) [PO]	14. Joint-welder identification records when such records are used in lieu of physical marking of welds (WB-4322) [PO]
7. Heat treatment records [PO] [Note (3)]	
8. Final hydrostatic and pneumatic test results (WA-5280) [PO]	

NOTES:

- (1) Nonconformance reports that affect those records listed shall be incorporated into the record or be retained with the records.
- (2) Letters in brackets identify organization responsible for record retention: DO = Design Owner, PO = Packaging Owner.
- (3) Either heat treatment charts or certified summaries of time and temperature data may be provided. These data may be included as part of the CMTR.

7. Calibration records (WA-4134.12) [PO]	Until recalibrated

NOTES:

- (1) Nonconformance reports which affect those records listed and are not incorporated into the record shall be retained for the retention period applicable to the record the nonconformance report affects.
 (2) Letters in brackets identify organization responsible for record retention: DO = Design Owner, PO = Packaging Owner.

ARTICLE WA-5000 AUTHORIZED INSPECTION

Page 37

Page 39

WA-5100 INTRODUCTION

WA-5110 APPLICABILITY

This Article provides the requirements for inspection by the Authorized Inspection Agency.

WA-5120 PERFORMANCE OF INSPECTION

WA-5121 Authorized Inspection Agency

(a) An Authorized Inspection Agency is one designated by, or is one acceptable to, the appropriate Enforcement Authority of a state of the United States or a province of Canada. The Authorized Inspection Agency shall be accredited by the Society in accordance with the provisions set forth in ASME QAI-1-1995.

(b) The Authorized Inspection Agency shall notify the Society when it enters into an agreement with a Design Owner or Class TP Certificate Holder, or whenever an existing agreement is terminated. The Authorized Inspection Agency shall also notify the Enforcement Authority whenever an agreement with a Design Owner, Packaging Owner, or Class TP

also notify the Enforcement Authority whenever an agreement with a Design Owner, Packaging Owner, or Class TP Certificate Holder is written or a Design Owner's, Packaging Owner, or Class TP Certificate Holder agreement is terminated.

WA-5122 Authorized Nuclear Inspector Supervisor

The Authorized Inspection Agency shall employ Authorized Nuclear Inspection Supervisors qualified in accordance with ASME QAI-1-1995, to supervise the Inspectors.

WA-5123 Authorized Nuclear Inspector

The Authorized Inspection Agency shall also employ Authorized Nuclear Inspectors qualified in accordance with ASME QAI-1-1995, to perform inspections required by this Division. The inspections required by this Division shall be performed by an Authorized Nuclear Inspector. Any reference to Inspector throughout this Division shall mean Authorized Nuclear Inspector. The Authorized Nuclear Inspector shall not be in the employ of a Design Owner, Packaging Owner, or Class TP Certificate Holder.

WA-5125 Duties of Authorized Nuclear Inspector Supervisors

(a) Supervisors, in conjunction with Inspectors employed by the same Authorized Inspection Agency (WA-5121), shall participate in the Society's review of the applicant's Quality Assurance Program (WA-8160). In those cases where the Supervisor performs the functions of the Inspector, he may represent both during the review of the Program. A Supervisor designated by the Authorized Inspection Agency shall review and accept any proposed modifications to Quality Assurance Manuals before they are put into effect. The Authorized Nuclear Inspector Supervisor shall audit the Inspector's performance at least twice per year at locations where the Class TP Certificate Holder is actively engaged in Section III work. The Supervisor shall be available as needed for consultation and support of the local inspection staff. The Supervisor shall maintain supervisory control over one or more Authorized Nuclear Inspectors and shall perform all of the functions and maintain the records required of him in ASME QAI-1-1995.

(b) The portion of a Class TP Certificate Holder's Quality Assurance Program that involves supply or manufacture and supply of materials [WA-3820(c)] shall be audited by the Supervisor at least once each year.

Page 40

WA-5130 ACCESS FOR INSPECTION AGENCY PERSONNEL

WA-5131 Access to the Class TP Certificate Holder's Facilities

(a) The Certificate Holder shall arrange for the Inspection Agency Personnel to have free access at all times to those locations where Code activities, including those concerned with supply or manufacture of materials, are being performed on an item, when so requested. The Class TP Certificate Holder shall keep the Inspector informed of the progress of the work and shall notify him reasonably in advance when the item will be ready for any required tests or inspections.

(b) The Class TP Certificate Holder shall provide personnel to accompany the Authorized Nuclear Inspector Supervisor during his required audits.

WA-5132 Access to the Design Owner's and Packaging Owner's Facilities

The Design Owner and Packaging Owner shall arrange for the Authorized Inspection Agency Personnel to have free access to the Design Owner's and Packaging Owner's facilities as required to perform duties under the Design Owner's and Packaging Owner's Agreement with the Authorized Inspection Agency (WA-5121).

WA-5200 DUTIES OF INSPECTOR

WA-5210 GENERAL INSPECTION DUTIES

(a) The Inspector who performs the detailed inspections in compliance with this Division shall witness or otherwise verify all examinations and make all inspections required by this Division. He shall also make any other inspections and witness or verify (including making measurements) any other examinations and additional investigations which, in his judgment, are

necessary to ascertain whether the item being inspected has been constructed (WA-1110) in compliance with the rules of this Division. Parts and piping subassemblies shall be in accordance with the accepted documents (WA-3251).

(b) The duties of the Inspector shall not be interpreted by virtue of these rules to extend to any construction requirements beyond those of this Division which may be set forth in the Construction Specifications (WA-3451). However, such requirements shall not result in construction which fails to conform with the requirements of this Division (WA-3570).

WA-5220 CATEGORIES OF INSPECTOR'S DUTIES

The duties of the Inspector shall include but not necessarily be limited to those given in (a) through (i) below:

(a) verifying the scope of work to be performed [WA-5230(a)];

(b) monitoring of the Design Owner's, Packaging Owner's, and Class TP Certificate Holder's Quality Assurance Program including subcontracted activities (WA-5240);

(c) reviewing of Design Owner's, Packaging Owner's, and Class TP Certificate Holder's qualification records (WA-5250);

(d) verifying materials (WA-5260);

(e) witnessing or verifying in-process fabrication, nondestructive examination, and tests (WA-5270);

(f) witnessing final pressure tests (WA-5280);

(g) certifying Data Reports and Construction Reports (WA-5290);

(h) reviewing drawings and inspecting in accordance with them;

(i) performing all other duties specifically required in ASME QAI-1-1995.

WA-5230 SCOPE OF WORK, DESIGN SPECIFICATIONS, DESIGN REPORTS, CONSTRUCTION SPECIFICATIONS, AND CONSTRUCTION REPORTS

(a) The Inspector shall verify that the scope stated in the N-type Certificate of Authorization includes the work to be performed.

(b) The Inspector shall verify that the Design Specification, Design Reports, Construction Specifications, and Construction Reports, when required (WA-3456 and WA-3561), are on file and that they have been properly certified in accordance with WA-3255 and WA-3455.

(c) The Inspector shall not be held responsible for the scope or adequacy of the Design Specifications, for the completeness or accuracy of the Design Report or calculations or for the qualification of registered Professional Engineers certifying documents in compliance with the requirements of this Division.

(d) The Inspector shall verify that Design Calculations have been prepared for those components not requiring Design Reports. The Inspector shall not be responsible for the accuracy of the calculations.

Page 41

WA-5240 QUALITY ASSURANCE PROGRAMS

WA-5241 Stipulation of Inspections Prior to Issuance of Process Sheets or Controls

Prior to the issuance of process sheets or controls required by WA-4134.9, the Class TP Certificate Holder shall review them and the applicable drawings with the Inspector, who shall then stipulate the inspections he intends to make in order to fulfill the requirements of WA-5210.

WA-5242 Monitoring of Quality Assurance Programs

(a) The Inspector shall monitor the performance of the Design Owner, Packaging Owner, and Class TP Certificate Holder for conformity to the requirements of their Quality Assurance Program accepted by the Society. The Inspector shall verify that all changes to the Quality Assurance Manual have been accepted by the Authorized Inspection Agency

before they are put into effect.

(b) The Inspector shall monitor the Packaging Owner's compilation supporting data needed to complete the ASME Data Report Form N-3.

WA-5243 Process Control Checklist

The Inspector shall indicate on the Class TP Certificate Holder's process sheets or checklist his concurrence that compliance has been attained at each point stipulated by him (WA-5241).

WA-5250 QUALIFICATION RECORDS

WA-5251 Review of Qualification Records

The Inspector shall review the qualification records of the Class TP Certificate Holder.

WA-5253 Welding Procedures

The Inspector shall assure himself that the welding procedures employed in construction have been qualified under the provisions of this Division. The Class TP Certificate Holder shall submit evidence to the Inspector that these requirements have been met. When there is a specific reason to question the welding procedure, the Inspector may require requalification as a requirement for the procedure to be used on work subject to his inspection.

WA-5254 Welders and Welding Operators

The Inspector shall assure himself that all welding is performed by welders or welding operators qualified under the provisions of this Division. The Class TP Certificate Holder shall make available to the Inspector a certified copy of the record of performance qualification tests of each welder and welding operator as evidence that these requirements have been met. When there is a specific reason to question the ability of the welder or the welding operator to make welds that meet the requirements of the specification, the Inspector may require requalification before the welder or welding operator is permitted to continue welding on work subject to his inspection. The Inspector shall also assure himself that each welder and welding operator has been assigned an identifying symbol and that such symbols are regularly and consistently applied when required by this Division.

WA-5255 Examination Procedures

The Inspector shall assure himself that the examination and testing procedures required by this Division have been qualified. When there is a specific reason to question whether the examination or testing procedure requirements are being met, the Inspector may require requalification of the procedure.

WA-5256 Nondestructive Examination Personnel

The Inspector has the duty to verify the qualification and certification of nondestructive examination personnel employed by the Class TP Certificate Holder and has the duty to monitor the nondestructive examination activities and require requalification of any personnel when there is reason to question the performance of that person. In addition, the Inspector shall monitor the Class TP Certificate Holder's Quality Assurance Program as it relates to the nondestructive examination activities of Material Organizations, and NDE subcontractors that the Certificate Holder qualified.

WA-5260 MATERIALS, PARTS, AND HEAT TREATMENT

WA-5261 Inspection of Materials for Compliance

The Inspector shall assure himself that all materials used comply with all applicable requirements of this Division. The Class TP Certificate Holder shall make available to the Inspector certified reports of the results

of all tests performed in accordance with (a) and (b) below:

(a) the material specifications;

(b) the requirements in the applicable materials Articles of this Division, including certified reports of the results of all required tests and examinations performed.

WA-5262 Dimensional Check

The Inspector shall satisfy himself:

(a) that the item is being constructed within the tolerance required by the Design Specification, Design Drawings, and Construction Specifications, and this Division;

(b) that head and shell sections conform to the prescribed shape and meet the thickness requirements;

(c) that fittings and attachments to be welded to the vessel fit properly to the curvature of the vessel surface. If required by the Inspector, the Class TP Certificate Holder responsible for the vessel shall make available accurately formed templates for his use.

WA-5263 Check of Heat Treatment Practice

The Inspector shall satisfy himself that all heat treatment operations required by this Division are correctly performed and that the temperature readings and gradients conform to the requirements.

WA-5270 EXAMINATIONS AND TESTS

The Inspector shall witness in-process fabrication nondestructive examinations and destructive tests, when feasible; alternatively, he shall check the examination and test records to determine the acceptability of the items involved.

WA-5280 FINAL TESTS

The Inspector shall witness final hydrostatic, pneumatic, structural integrity, or leakage tests required by this Division and examinations performed during such tests by the Class TP Certificate Holder.

WA-5290 CERTIFICATION OF DATA REPORTS AND CONSTRUCTION REPORTS

(a) The appropriate Data Reports prepared by the Class TP Certificate Holder shall be certified by the Inspector only after they have been certified by a responsible representative of the Class TP Certificate Holder and after he has satisfied himself that all requirements of this Division have been met and that each Data Report certified is a correct record.

(b) The N-3 Data Report Form (WA-3220) shall be certified by the Inspector only after:

(1) it has been certified by the Packaging Owner;

(2) the Inspector has reviewed the N-3 Form and verified that the Data Reports referenced on the N-3 Form are on file and that such Data Reports verify Code compliance of all components or parts incorporated into the containment system of the transport packaging or that portion of the system covered by the N-3 Form.

WA-5300 RESPONSIBILITIES OF THE AUTHORIZED INSPECTION AGENCY

The responsibilities of the Authorized Inspection Agency shall include but not necessarily be limited to those given in (a) through (k) below.

(a) Maintain a staff of Authorized Nuclear Inspectors and Authorized Nuclear Inspector Supervisors (WA-5123).

(b) Make agreements with Design Owners, Packaging Owners, and Class TP Certificate Holders for inspection service (WA-5121 and WA-8130). Notify the Society whenever such agreements are terminated (WA-5121).

(c) Provide for participation in the Society's review of the applicant's Quality Assurance Program (WA-5125).

(d) Provide for the review and acceptance of any proposed modifications to Quality Assurance Manuals before they are put into effect (WA-5125).

(e) Review and accept the Class TP Certificate Holder's method of securing the nameplate to components to which, because of size or other considerations, the nameplate cannot be directly attached [WA-8220(b)].

(f) Review and accept the Class TP Certificate Holder's alternative method of identification, including the unique method of marking of components to which, because of size or other considerations, nameplates cannot be directly attached [WA-8220(b)].

(g) Review and accept the Class TP Certificate Holder's alternative method of marking of parts and piping subassemblies (WA-8230).

(h) Review and accept the Class TP Certificate Holder's provisions of positive identification and traceability of items from which nameplates are removed [WA-8240(b)].

Page 43

(i) Determine by agreement with the Class TP Certificate Holder the sequence for stamping and the completion of the Code Data Report [WA-8130(c)].

(j) Review and accept the Class TP Certificate Holder's procedure for providing traceability of parts or piping subassemblies which are furnished without stamping (WA-8332).

(k) And all other duties specifically required in ASME QAI-1-1995.

July 1, 1998

American Society Of Mechanical Engineers

SEC III D3 WA-8000

ARTICLE WA-8000 CERTIFICATES OF AUTHORIZATION, NAMEPLATES, CODE SYMBOL STAMPING, AND DATA REPORTS

Page 45

Page 46

WA-8100 AUTHORIZATION TO PERFORM CODE ACTIVITIES

WA-8110 GENERAL

Certificates of Authorization to use the official Code Symbol Stamps shown in Table WA-8100-1 or Certificates of Accreditation to certify work by other means provided in this Division will be granted by the Society for a 3 year period pursuant to the provisions set forth in this Subarticle.

WA-8120 SCOPE OF AUTHORIZATION

(a) The N-type Certificate of Authorization (WA-3120) will identify the facility covered and state the scope of activities for which authorization is granted. The Society may, at its discretion, limit or extend the scope of an authorization to any types or classes of items or to a specific location.

(b) The Society may, at any time, make regulations concerning the issuance and use of Certificates and Code Symbol Stamps as it deems appropriate, and all regulations shall become binding upon the holders of a valid Certificate.

WA-8130 INSPECTION AGREEMENT REQUIRED

Design Owners, Packaging Owners, and Class TP Certificate Holders shall possess an agreement with an Authorized Inspection Agency to provide inspection and audit services. The agreement with the Authorized Inspection Agency shall be made prior to application for a survey or, in the case of the Design Owner or Packaging Owner, an interview. Design Owners, Packaging Owners, and Class TP Certificate Holders shall notify the Society whenever their agreements with an

Owners, Packaging Owners, and Class TP Certificate Holders shall notify the Society whenever their agreements with an Authorized Inspection Agency are cancelled or changed to another Authorized Inspection Agency.

WA-8140 QUALITY ASSURANCE PROGRAM REQUIREMENTS

It is a requirement that a Class TP Certificate Holder have a Quality Assurance Program (WA-4000) which has been evaluated and accepted by the Society.

WA-8150 APPLICATION FOR AUTHORIZATION

An Organization desiring a Class TP Certificate of Authorization shall apply to the Society upon forms issued by the Society describing the scope of Code activities to be performed.

WA-8152 Shop Assembly

Shop assembly of components to components, or components to piping subassemblies or other items, may be by N Certificate Holders if such activities are included within the scope of their N-type Certificate of Authorization.

WA-8153 Code Activities Prior to Certification

Code activities performed prior to issuance of a N-type Certificate of Authorization shall be subject to the acceptance of the Inspector.

**TABLE WA-8100-1
AUTHORIZATIONS AND CODE SYMBOL STAMPS ISSUED BY THE SOCIETY FOR CONSTRUCTION OF
CONTAINMENT SYSTEMS FOR TRANSPORT PACKAGING**

Type of Organization	Scope	Division 3 Class TP	Data Report Form	Notes
N	Containment system of transport packaging	 TP	...	...
NPT	Tubular products welded with filler metal	 TP	NM-1	(2)
	Part	 TP	N-2	(1), (3)
	Piping subassembly	 TP	NPP-1	...
Quality System Certificate Holder	Material	None	None	(2)
Design/Packaging Owner	Owner	None None	...	...

NOTES:

- (1) Data Report Form N-2 for parts shall be forwarded in duplicate to the Certificate Holder of the finished component.
- (2) Material (WA-1220) shall be documented by a Certified Material Test Report or a Certificate of Compliance in accordance with WB-2000.
- (3) A multiple number of parts may be included on the N-2 Data Report, provided the parts are of the same class, size, and design and that the parts are manufactured for the same N-type Certificate of Authorization Holder and authorized by the Inspector for stamping on the same day. Each part must be identified on the Data Report by an individual serial number.

**TABLE WA-8100-1 AUTHORIZATIONS AND CODE SYMBOL STAMPS ISSUED BY THE SOCIETY FOR
CONSTRUCTION OF CONTAINMENT SYSTEMS FOR TRANSPORT PACKAGING**

WA-8160 EVALUATION FOR AUTHORIZATION

WA-8161 Evaluation for a Class TP Certificate of Authorization

(a) Applicants for a new or renewed N-type Certificate of Authorization for Class TP construction require a survey of their shop facilities. The purpose of the survey is to evaluate the applicant's Quality Assurance Manual and the implementation of the Quality Assurance Program.

(b) The extent of the survey will be determined by the Society based on a review of the applicant's intended scope of Code activities described in the application. The acceptance by the Society of the Quality Assurance Program shall not be interpreted to mean endorsement of technical capability to perform design work such as system design or stress analysis. Such capability is implied for the specific component involved by the certification of Design Reports (WA-3555) by a Registered Professional Engineer.

(c) Authorization to apply a Code Symbol Stamp to an item will be granted only after a survey by the Society has satisfactorily demonstrated the adequacy and implementation of the Quality Assurance Program.

WA-8162 Evaluation for an Interim Letter

(a) It is not essential that the applicant's Quality Assurance Program be in actual use or ever have been used prior to or at the time of the Society's survey, provided the applicant has the capability to staff, equip, and otherwise implement the Program as described. An applicant whose Quality Assurance Program has been so accepted may be issued an Interim Letter for a period of 1 year indicating acceptance of the Quality Assurance Program as described in the Manual.

(b) An interim letter may be renewed annually, but not more than twice, subject to the following:

(1) an agreement with an Authorized Inspection Agency is in effect;

(2) the Quality Assurance Manual has been determined by the Authorized Nuclear Inspection Supervisor to be in compliance with the requirements of this Division.

Page 49

WA-8163 Evaluation for a Design Owner's or Packaging Owner's Certificate

(a) The Design Owner and the Packaging Owner, shall obtain a Design Owner's and a Packaging Owner's Certificate (WA-3230 and WA-3430) from the Society. In lieu of a survey, the Design Owner and Packaging Owner will be interviewed for the Society to verify the Design Owner and Packaging Owner's understanding of Code responsibilities (WA-3220 and WA-3420) and to obtain the Design Owner and Packaging Owner's agreement to meet the requirements.

WA-8170 ISSUANCE OF AUTHORIZATION

Each Certificate Holder shall have agreed that each Certificate and Code Symbol Stamp (if one is issued) is at all times the property of the Society, that it will be used according to the rules and regulations of this Division, and that the Certificate and Code Symbol Stamp will be promptly returned to the Society upon demand, or when the Certificate Holder discontinues the scope of Code activities covered by his Certificate. The holder of a Code Symbol Stamp shall not permit any other party to use its Certificate or Code Symbol Stamp. The Society reserves the absolute right to cancel or refuse to renew such authorization, returning fees paid for the prorated unexpired term.

WA-8180 RENEWAL OF AUTHORIZATION

Not later than 6 months prior to the date of expiration of any Certificate, the Certificate Holder shall apply for a renewal of such authorization and the issuance of a new Certificate.

WA-8200 NAMEPLATES AND STAMPING

WA-8210 GENERAL REQUIREMENTS

WA-8211 Nameplates

Each item to which a Code Symbol Stamp is applied shall have a nameplate, except as otherwise permitted by this Subarticle. Marking shall be as required by (a) through (e) below:

- (a) the applicable official Code Symbol Stamp, as shown in Table WA-8100-1;
- (b) Class of construction;
- (c) the statement "Certified by";
- (d) Class TP Certificate Holder's name;

N
TP

Certified by

(Name of Class TP Certificate Holder)

(Year Stamped) **(Containment System Serial number)**

FIG. WA-8212-1 FORM OF STAMPING

FIG. WA-8212-1 FORM OF STAMPING

- (e) Containment System serial number and, if applicable, national board number and/or Canadian registration number.

WA-8212 Stamping

The Code Symbol Stamp shall be stamped on a nameplate attached to an item, except as otherwise permitted by this Subarticle. The arrangement of markings shall be as shown in Fig. WA-8212-1. The data shall be in characters not less than $\frac{3}{32}$ in. (2.4 mm) high. The selected method shall not result in any harmful contamination or sharp discontinuities. Stamping directly on items, when used, shall be done with blunt-nosed continuous or blunt-nose interrupted dot die stamps.

WA-8213 Attachment of Nameplates

- (a) The nameplate shall be attached by a method that will not affect the structural integrity of the item.
- (b) If the nameplate is marked before it is attached, the Class TP Certificate Holder shall assure that the nameplate with the correct marking has been attached and the Inspector shall verify that this has been done.
- (c) When nameplates are attached with pressure sensitive acrylic adhesive systems, in addition to the requirements of this Article, those of Appendix XXI shall be met.

WA-8220 NAMEPLATES FOR CONTAINMENT SYSTEMS

(a) The markings required by WA-8210 shall be applied to a separate nameplate attached to the containment system. The name plate shall be of a visible, permanent type and not detrimental to the containment system. The type, method, and manner of marking

Page 50

shall be described in the Certificate Holder's Quality Assurance Program or Procedure.

(b) If because of size or other considerations the nameplates cannot be directly attached to the containment system, the Class TP Certificate Holder may secure the nameplate in a manner acceptable to the Authorized Inspection Agency. The use of this alternative method of identification, including the method of marking, shall be reviewed by and found acceptable to the Authorized Inspection Agency (WA-5121) prior to implementation by the Class TP Certificate Holder.

WA-8230 NAMEPLATES FOR NPT STAMPED ITEMS

(a) Parts and piping subassemblies shall have a separate nameplate equivalent to that required for completed components when the size and use of the item will accommodate such a nameplate. When the size or use of the item will not permit the installation of a nameplate, the marking shall consist of suitable identification of the item until it has been incorporated into the finished component or other NPT stamped item. This alternative method of marking shall be reviewed with and found acceptable to the Authorized Inspection Agency before being used by the Class TP Certificate Holder.

(b) In the case of tubular products welded with filler metal, nameplates are not required. The marking shall be applied directly to the material by etching or stamping.

WA-8300 CODE SYMBOL STAMPS

WA-8310 GENERAL REQUIREMENTS

(a) The Code Symbol Stamp shall be applied by the Class TP Certificate Holder only with authorization of the Inspector. In any case, the Code Symbol Stamp shall not be applied until completion of the required examination and testing.

(b) Table WA-8100-1 provides Code Symbol Stamp requirements as related to type of certificates, scope of work, and class of construction. The Class of construction shall be indicated by the letters TP stamped below and outside the official Code Symbol Stamp.

(c) The completed Code Data Report Form N-5 certifies that the Inspector has inspected the item and authorized the application of the Code Symbol Stamp. The sequence for stamping and the completion of the Code Data Report shall be determined by agreement between the Authorized Inspection Agency and the Class TP Certificate Holder.

WA-8330 REMOVABLE ITEMS

(a) Removable items which form part of a containment system shall have unique markings identifiable to the containment system.

WA-8400 DATA REPORTS

WA-8410 GENERAL REQUIREMENTS

The appropriate Data Report,¹ as specified in Table WA-8100-1, shall be filled out by the Class TP Certificate Holder or Packaging Owner and shall be signed by the Class TP Certificate Holder or Packaging Owner and the Inspector for each item (except as provided elsewhere in this Article) to be marked with a Code Symbol Stamp.

WA-8411 Compiling Data Report Records

Data Reports, which are the basis for approval of the N-3 and N-5 Data Reports, may be compiled in any one of the following methods:

(a) by attaching each Data Report for items which make up the containment system of the transport packaging to its respective N-3 or N-5; or

(b) by assigning each Data Report for items which make up the containment system of the transport packaging a unique identifying number and listing the numbers on the Data Report N-3 or N-5; or

(c) by attaching a drawing which uniquely identifies each item which make up the containment system of the transport packaging to its respective Data Report N-3 or N-5.

WA-8412 Availability of Data Reports

All Data Reports and referenced supporting material shall be available to the Inspector and enforcement authority having jurisdiction.

1 Samples of the forms referred to in this Subarticle may be found in Appendix V. Copies of these forms may be obtained from the Society.

WA-8420 PACKAGING OWNER'S DATA REPORT

The Packaging Owner who has obtained a Packaging Owner's Certificate of Accreditation shall be responsible for completing one or more of N-3. The Packaging Owner shall certify, by signing the form, that each

Page 51

Class TP Certificate Holder was the holder of the appropriate N-type Certificate of Authorization and that the containment system complies with the applicable requirements of this Division. Review of the completed Packaging Owner's Data Report N-3, including attached Data Reports for all components and installation as required to verify Code Compliance, shall be the Inspector's authority to sign the Packaging Owner's Data Report.

WA-8430 DATA REPORTS, TUBULAR PRODUCTS, AND FITTINGS WELDED WITH FILLER METAL

(a) Each piece of tubular products or fittings with filler metal shall be listed on a Data Report Form NM-1. This Data Report shall be completed by the Certificate Holder and signed by the Inspector.

(b) Multiple items may be listed on a single NM-1 Data Report Form, provided they are from the same heat and lot of material.

(c) When tubular products welded with filler metal are used to manufacture fittings, all the fittings made from the NPT stamped tubular product may be identified on one CMTR or NM-1, as applicable, prepared by the fitting manufacturer, which lists all the operations performed. The fitting manufacturer shall provide a copy of his CMTR or NM-1, as applicable, and a copy each of the CMTR and the NM-1 Data Report which were supplied with the tubular product.

American Society Of Mechanical Engineers

SEC III D3 WA-9000

ARTICLE WA-9000 GLOSSARY

Page 53

WA-9100 INTRODUCTION

This Article defines selected terms used in this Section. The definitions in this Glossary shall prevail should a conflict exist with definitions found elsewhere in this Division or other documents referenced in this Division.

WA-9200 DEFINITIONS

Approved Supplier. A supplier that has been evaluated and approved by a Material Organization or Certificate Holder in accordance with the requirements of WA-3800.

Appurtenance. An item intended to be attached to a completed and stamped component which has work performed on it requiring verification by an Inspector.

Assembly. A grouping of Code items joined by mechanical means, welding, or brazing.

Audit. A documented evaluation performed to verify, by examination of objective evidence, that those selected elements of a previously approved quality program have been developed, documented, and implemented in accordance with specified requirements. An audit does not include surveillance or inspection for the purpose of process control, or acceptance of material or items.

Authorized Inspection Agency. An Authorized Inspection Agency is one designated as such by the appropriate legal authority of a state or municipality of the United States or by a province of Canada.

Authorized Nuclear Inspector. An Authorized Nuclear Inspector is an employee of an Authorized Inspection Agency who has qualifications for and has been properly qualified for Division 3.

Authorized Nuclear Inspector Supervisor. An Authorized Nuclear Inspector Supervisor is an employee of an Authorized Inspection Agency who has been assigned by that agency to oversee and direct the work of one or more Authorized Nuclear Inspectors and who has qualifications for and has been properly qualified for Division 3.

Certificate of Authorization. A document issued by ASME which authorizes the use of an ASME Code Symbol Stamp for a specified time and for a specified scope of activity.

Certificate of Compliance. A written statement attesting that the materials are in accordance with specified requirements.

Certificate Holder. An organization holding a valid N or NPT Certificate of Authorization issued by the Society.

Certification. The act of verifying and attesting in writing that documents, processes, procedures, items, or the qualifications of personnel are in accordance with specified requirements.

Certified Material Test Report. A document attesting that the material is in accordance with specified requirements, including the actual results of all required chemical analyses, tests, and examinations.

Code Addenda. Additions and revisions to individual sections of the Code published annually.

Code Cases. Documents issued by the Society to clarify the intent of existing Code requirements or to provide alternative rules for construction.

Code Class. The classification, specified by the Owner (or his designee) and included in the Design Specification, which establishes the rules for design and construction of items.

Code Editions. Documents issued at 3 year intervals by the Society which include all revisions and additions previously included in Addenda and corrections included in Errata published since the previous Edition.

Code Symbol Stamp. A metallic stamp issued by the Society for use in impressing one of the symbols shown in Table WA-8100-1.

Compliance. Conforming to the Code, a specification, or a procedure.

Page 56

Component. A vessel or valve, storage tank, piping system, that is designed, constructed, and stamped in accordance with the rules of this Division.

Construction (as used in Division 3). All operations required to build an item in accordance with Design Drawings and the Construction Specification.

Construction Documents. Shop drawings, field drawings, construction reports, construction procedures, and material documentation.

Construction Procedure. A written description of construction or fabrication methods the Constructor or Fabricator uses to ensure conformance with the requirements of the Construction Specification, Design Drawings, and this Division.

Construction Report. A report prepared by the Constructor that summarizes activities performed to construct the component

in accordance with the Construction Specification, Design Drawings, and the requirements of this Division.

Construction Specification. A document prepared by the Designer that establishes requirements for the construction of a component.

Corrective Action. Measures taken to rectify conditions adverse to quality, and, where necessary, to preclude repetition.

Data Report. A document which certifies that an item was constructed in accordance with the requirements of this Division.

Data Report Form. The form approved by the Society which is used to record the required Code Data.

Defective Material. Material that does not meet specified requirements.

Design Drawings. Drawings which are prepared to illustrate the structural and mechanical details necessary to comply with the Design Specification and this Division.

Design Report. The design document which shows that the allowable limits stated in this Division are not exceeded for the loadings specified in the Design Specification.

Design Specification (Division 3). A document prepared by the Design Owner which provides a complete basis for design in accordance with this Division.

Destructive Test. A test to determine the properties of a material or the behavior of an item which results in the destruction of the sample or item.

Discrepancy. A condition outside of an established tolerance or requirement.

Document Control. Those measures established to control the preparation, review, release, issuance, and disposition of documents, such as design calculations, purchase orders, specifications, instructions, procedures, and drawings, including changes thereto, which describe or document activities affecting quality.

Enforcement Authority. A regional or local governing body, such as a state or municipality of the United States or a Canadian province, empowered to enact and enforce boiler and pressure vessel legislation.

Environmental Conditions. Those conditions to which the item is subjected such as radiation, pressure, temperature, humidity, site elevation, wind, and wind direction.

Examination. Specific actions by qualified personnel using qualified procedures to verify that items and fabrication processes are in conformance with specified requirements. This term, when used in conjunction with qualification of personnel to perform quality-related activities, shall mean a written examination.

Fabrication. Those actions required to manufacture components, parts, and appurtenances. These actions may include forming, machining, assembling, welding, brazing, heat treating, examination, testing, inspection, and certification. Fabrication does not include design.

Hold Point. A designated stopping place during or following a specific activity at which inspection or examination is required before further work can be performed.

Hydrostatic Test. The pressurization of an item to a test pressure using water or other liquid as a testing medium with the required examination prescribed by the Code.

Identification and Verification Program. A documented system for the positive identification of material during storage and handling and verification of the identity of material on the accompanying Certified Material Test Report at the time of shipment.

Inspector. The Authorized Nuclear Inspector as defined in WA-5122. The term Inspector, as used in this Subsection, is the same as the term Authorized Inspector as used in Division 3.

Installation. Those actions required to place and attach components to their supports and join items of a nuclear power system by welding or mechanical means.

Instructions. Detailed written directions provided to persons or organizations to ensure proper completion of a task.

Item. A product constructed under a Certificate of Authorization (WA-3120) or material (WA-1220).

Joining. The act of connecting two or more items to one another, by welding, brazing, bolting, or other mechanical means.

Page 57

Jurisdictional Boundaries. The physical limits of a Code item which are identified to determine the applicability of Code rules for that item.

Material. For Section III, Division 3, metallic materials manufactured to an SA, SB, SFA, or any other material specification permitted by the Division.

Material Organization (Metallic). An organization accredited by holding Quality System Certificate issued by the Society, or qualified by an accredited Material Organization or Certificate Holder, in accordance with the requirements of Section III, WA-3800.

Material Specification. A document which establishes the requirements for a material.

Modification. A change to an item made necessary by, or resulting in, a change in design requirements.

Monitor. Observe or check compliance with this Division and the Owner's or Certificate Holder's Quality Assurance Program. This activity is not necessarily documented or required to be continuous.

Nonconformance. A deficiency in a characteristic, documentation, or procedure that renders an item or activity unacceptable or indeterminate.

Part. An item which is attached to or becomes a portion of a component or component support before completion and stamping of the component or component support. Parts have work performed on them requiring verification by an Inspector.

Performance Assessment. For Section III, a documented evaluation of material supplied by a previously audited and accepted Quality System Program to verify continued compliance with Code requirements.

Piping Subassembly. A section of piping system consisting of fittings and pipes or tubes which are fabricated as subassemblies in a shop or in the field before being installed in a nuclear power system.

Pneumatic Test. The pressurization of an item to a test pressure using a gas as the testing medium with the required examination prescribed by the Code.

Qualified Procedure. A procedure that has been demonstrated to meet the specified requirements for its intended purpose.

Quality Assurance. As used in this Division, quality assurance comprises all those planned and systematic actions necessary to provide adequate confidence that all items designed and constructed are in accordance with the rules of this Section.

Quality Assurance Manual. A written document which describes a Quality Assurance Program.

Quality Assurance Program. A controlled system of planned and systematic actions required to provide adequate confidence that items designed and constructed are in accordance with the rules of the Code.

Quality Control. Measurement of the characteristics of an item or process to determine conformance to specified requirements.

Quality System Certificate. A Certificate issued by the Society that permits an organization to perform specified Material Organization activities in accordance with Code requirements.

Quality System Program. A documented system of actions required to provide adequate confidence that materials conform to the requirements of the material specification and the rules of Section III.

Regulatory Authority. A Federal Government Agency, such as the United States Nuclear Regulatory Commission, empowered to issue and enforce regulations concerning the design, construction, and operation of nuclear power plants.

Repair. The process of physically restoring a nonconformance to a condition such that an item complies with Code requirements.

Rework. Refer to *Repair*.

Service. An activity performed by a subcontractor such as designing, rigging, temporary bolting, and nondestructive examination.

Service Limits. Stress and stress intensity limits applicable to Service Loadings given in the Design Specification.

Shop Drawings. Drawings provided by the Class TP Certificate Holder which describe construction, details, physical dimensions, arrangements, and any significant engineering features needed to establish conformance to the Construction Specification, and this Division.

Society. The American Society of Mechanical Engineers, Three Park Avenue, New York, NY 10016-5990.

Source Material. For Section III, metallic products used for conversion to or qualification as material by a Certificate Holder or Material Organization.

Special Process. A process, the results of which are highly dependent on the control of the process or skill of the operator, or both.

Survey. A documented evaluation of an organization's ability to perform Code activities as verified by a determination of the adequacy of the organization's quality program and by a review of the implementation of that program at the location of the work.

Testing. An element of verification for the determination of the capability of an item to meet specified requirements by subjecting the item to a set of physical, chemical, environmental, or operating conditions.

Page 58

Traceability. The ability to verify the history, location, or application of an item by means of recorded identification.

Unqualified Source Material. Source material not produced by a Certificate Holder, Material Organization, or approved supplier in accordance with the requirements of Section III, WA-3800.

Use-as-is. Only applicable requirements of this Division have been met.

Verification. A review to ensure that activities have been performed and documented in accordance with applicable requirements.

SEC III D3 WB-1000

ARTICLE WB-1000 INTRODUCTION

Page 59

SUBSECTION WB

CLASS TP (TYPE B) CONTAINMENT

Page 61

WB-1100 SCOPE AND GENERAL REQUIREMENTS

WB-1110 ASPECTS OF CONSTRUCTION COVERED BY THESE RULES

(a) Subsection WB establishes rules for material, design, fabrication, examination inspection testing, and preparation of reports for containment systems of transport packagings.

(b) The rules of Subsection WB cover the requirements for strength and pressure integrity of items, the failure of which would violate the pressure-retaining boundary. The rules cover initial construction requirements, but do not cover

deterioration which may occur in service as a result of corrosion, radiation effects, or instability of material. WA-1130 gives further limitations to the rules of this Subsection.

[98]

WB-1120 RULES FOR TP CONTAINMENT SYSTEMS OF TRANSPORT PACKAGINGS

(a) Class TP containment systems of transport packagings shall be constructed in accordance with the rules of this Division. Only containment vessels and their appurtenances shall be classified as Class TP. Piping and valves which are part of the containment systems of transport packagings (WB-1130) or which penetrate or are attached to the containment vessel shall be classified as Class 1 by the Design Specification and shall meet the requirements of the applicable Subsection of Division 1.

(b) Subsection WB does not contain rules to cover all details of construction of TP containment systems of transport packagings. The Certificate Holder shall provide details of construction which will be consistent with those provided by the rules of this Division. These details of construction shall be subject to the approval of the Packaging Owner or his designee and acceptance by the Inspector.

[98]

WB-1130 BOUNDARIES OF JURISDICTION

WB-1131 Boundaries of the Containment System of a Transport Packaging

The containment system may include (a) and (b) as follows:

(a) the containment vessel;

(b) all penetration assemblies or appurtenances attached to the containment vessel; Boundaries of such items shall be given in the Design Specifications (WA-3250 and WB-1120).

WB-1132 Boundaries of the Containment Vessel

The Design Specification shall define the boundary of a containment vessel.

July 1, 1998

American Society Of Mechanical Engineers

SEC III D3 WB-2000

ARTICLE WB-2000 MATERIAL

Page 65

WB-2100 GENERAL REQUIREMENTS FOR MATERIAL

WB-2110 SCOPE OF PRINCIPAL TERMS EMPLOYED

(a) The term *material* as used in this Subsection is defined in WA-1220. The term *Material Organization* is defined in WA-3800.

(b) The term *containment system material* as used in this Subsection applies to items such as vessel shells and heads; reinforcement around openings and penetrations and appurtenances such as leak testing and drainage ports, and structural reinforcements required by design to maintain structural integrity.

(c) The requirements of this Article make reference to the term *thickness*. For the purpose intended, the following definitions of nominal thickness apply.

(1) *plate* - the thickness is the dimension of the short transverse direction

(2) *forgings* - the thickness is the dimension defined as follows:

- (a) *hollow forgings* - the nominal thickness is measured between the inside and outside surfaces (radial thickness)
- (b) *disk forgings* (axial length less than the outside diameter) - the nominal thickness is the axial length
- (c) *flat ring forgings* (axial length less than the radial thickness) - for axial length ≤ 2 in. (51 mm), the axial length is the nominal thickness. For axial length > 2 in. (51 mm), the radial thickness is the nominal thickness.
- (d) *rectangular solid forgings* - the least rectangular dimension is the nominal thickness
- (3) *castings*
 - (a) Thickness t for fracture toughness testing is defined as the nominal pipe wall thickness of the connecting piping.
 - (b) Thickness t for heat treatment purposes is defined as the thickness of the pressure retaining wall of the casting, excluding flanges and sections designated by the designer as nonpressure retaining.

WB-2120 CONTAINMENT SYSTEM MATERIAL

WB-2121 Permitted Material Specifications

- (a) Containment system material and material welded thereto, except as permitted in WB-4435, and except for welding, brazing, and hard surfacing metals and cladding which is 10% or less of the thickness of the base material (WB-3122), shall conform to the requirements of one of the specifications for material given in Section II, Part D for Division 1, Class 1 or Division 3, Class TP construction and to all of the special requirements of this Article which apply to the product form in which the material is used.
- (b) The requirements of this Article do not apply to seals, packaging, gaskets, and valve seats.
- (c) Material made to specifications other than those specified in Section II, Part D, for Division 1, Class 1 or Division 3, Class TP may be used for pressure relief disks.
- (d) Material for instrument line fittings, NPS 1 (DN 25) and less, may be of material made to specifications other than those listed in Appendix 1 provided that the material is determined to be adequate for the service conditions by the containment system designer.
- (e) Welding and brazing material used in the manufacture of items shall comply with an SFA specification in Section II, Part C, except as otherwise permitted in Section IX, and shall also comply with the applicable requirements of this Article. The requirements of this Article do not apply to material used as backing rings or backing strips in welded joints.

Page 72

WB-2122 Special Requirements Conflicting With Permitted Material Specifications

Special requirements stipulated in this Article shall apply in lieu of the requirements of the material specification wherever the special requirements conflict with the material specification requirements (WA-3856). Where the special requirements include an examination, test, or treatment which is also required by the material specification, the examination, test, or treatment need be performed only once. Required nondestructive examinations shall be performed as specified for each product form in WB-2500. Any examination, repair, test, or treatment required by the material specification or by this Article may be performed by the Material Organization or the Certificate Holder as provided in WB-4121. Any hydrostatic or pneumatic pressure test required by a material specification need not be performed, provided the material is identified as not having been pressure tested and it is subsequently pressure tested in the system in accordance with WB-6114, except where the location of the material in the component or the installation would prevent performing any nondestructive examination required by the material specification to be performed subsequent to the hydrostatic or pneumatic test.

WB-2123 Size Ranges

Material outside the limits of size or thickness given in any specification in Section II may be used if the material is in compliance with the other requirements of the specification and no size limitation is given in the rules for construction. In those specifications in which chemical composition or mechanical properties are indicated to vary with size or thickness,

any material outside the specification range shall be required to conform to the composition and mechanical properties shown for the nearest specified range (WA-3856).

WB-2124 Fabricated Hubbed Flanges

Fabricated hubbed flanges shall be in accordance with the following.

(a) Hubbed flanges may be machined from a hot rolled or forged billet. The axis of the finished flange shall be parallel to the long axis of the original billet. (This is not intended to imply that the axis of the finished flange and the original billet must be concentric.)

(b) Hubbed flanges, except as permitted in (a) above, shall not be machined from plate or bar stock material unless the material has been formed into a ring, and further provided that:

(1) in a ring formed from plate, the original plate surfaces are parallel to the axis of the finished flange (this is not intended to imply that the original plate surface must be present in the finished flange);

(2) the joints in the ring are welded butt joints that conform to the requirements of this Division. Thickness to be used to determine postweld heat treatment and radiography requirements shall be the lesser of t , or $(A - B)/2$, where these symbols are as defined in Appendix XI-3130.

(c) The back of the flange and the outer surface of the hub shall be examined by the magnetic particle method or the liquid penetrant method in accordance with WB-2540 to ensure that these surfaces are free from defects.

WB-2125 Bolting Material

(a) Material for bolts and studs shall conform to the requirements of one of the specifications listed in Section II, Part D, Subpart 1, Table 4. Material for nuts shall conform to SA-194 or to the requirements of one of the specifications for nuts or bolting listed in Section II, Part D, Subpart 1, Table 4.

(b) The use of washers is optional. When used, they shall be made of wrought material with mechanical properties compatible with the nuts with which they are to be employed.

WB-2130 CERTIFICATION OF MATERIAL

All material used in construction of components shall be certified as required in WA-3862. Certified Material Test Reports are required for containment system material except as provided by WA-3862. A Certificate of Compliance may be provided in lieu of a Certified Material Test Report for all other material. Copies of all Certified Material Test Reports and Certificates of Compliance applicable to material used in a component shall be furnished with the material.

WB-2140 WELDING MATERIAL

For the requirements governing the material to be used for welding, see WB-2400.

WB-2150 MATERIAL IDENTIFICATION

The identification of containment system material and materials welded thereto shall meet the requirements of WA-3856. Material for small items shall be controlled

Page 73

during manufacture and installation of a component so that they are identifiable as acceptable material at all times. Welding and brazing material shall be controlled during the repair of material and the manufacture and installation so that they are identifiable as acceptable until the material is actually consumed in the process (WB-4122).

WB-2160 DETERIORATION OF MATERIAL IN SERVICE

Consideration of deterioration of material caused by service is generally outside the scope of this Division. It is the responsibility of the N Certificate Holder to select material suitable for the conditions stated in the Design Specifications (WA-3250), with specific attention being given to the effects of service conditions upon the properties of the material. Any

special requirement shall be specified in the Design Specifications (WA-3252 and WB-3124). When so specified, the check analysis shall be made in accordance with the base metal specification and in accordance with WB-2420 for the welding material.

WB-2170 HEAT TREATMENT TO ENHANCE IMPACT PROPERTIES

Carbon steels, low alloy steels, and high alloy chromium (Series 4XX) steels may be heat treated by quenching and tempering to enhance their impact properties. Postweld heat treatment of the component at a temperature of not less than 1100°F (593°C) may be considered to be the tempering phase of the heat treatment.

WB-2180 PROCEDURES FOR HEAT TREATMENT OF MATERIAL

When heat treating temperature or time is required by the material specification and the rules of this Subsection, the heat treating shall be performed in temperature-surveyed and -calibrated furnaces or shall be performed with thermocouples in contact with the material or attached to blocks in contact with the material. Heat treating shall be performed under furnace loading conditions such that the heat treatment is in accordance with the material specification and the rules of this Division.

WB-2200 MATERIAL TEST COUPONS AND SPECIMENS FOR FERRITIC STEEL MATERIAL

WB-2210 HEAT TREATMENT REQUIREMENTS

WB-2211 Test Coupon Heat Treatment for Ferritic Material¹

Where ferritic steel material is subjected to heat treatment during fabrication or installation of a component, the material used for the tensile and impact test specimens shall be heat treated in the same manner as the component, except that test coupons and specimens for P-No. 1 material with a nominal thickness of 2 in. (51 mm) or less are not required to be so heat treated. The Certificate Holder shall provide the Material Organization with the temperature and heating and cooling rate to be used. In the case of postweld heat treatment, the total time at temperature or temperatures for the test material shall be at least 80% of the total time at temperature or temperatures during actual postweld heat treatment of the material, and the total time at temperature or temperatures for the test material, coupon, or specimen may be performed in a single cycle.

WB-2212 Test Coupon Heat Treatment for Quenched and Tempered Material

WB-2212.1 Cooling Rates.

Where ferritic steel material is subjected to quenching from the austenitizing temperature, the test coupons representing that material shall be cooled at a rate similar to and no faster than the main body of the material except in the case of certain forgings and castings (WB-2223.2 and WB-2226). This rule shall apply to coupons taken directly from the material as well as to separate test coupons representing the material, and one of the general procedures described in WB-2212.2 or one of the specific procedures described in WB-2220 shall be used for each product form.

1 Any postweld heat treatment time which is anticipated to be applied to the material or item after it is completed shall be specified in the Design Specification. The Certificate Holder shall include this time in the total time at temperature specified to be applied to the test specimens.

WB-2212.2 General Procedures.

One of the general procedures stipulated in (a), (b), and (c) below may be applied to quenched and tempered material or test coupons representing the material, provided the specimens are taken relative to the surface of the product in accordance with WB-2220. Further specific details

Page 74

of the methods to be used shall be the obligation of the Material Organization and the Certificate Holder.

(a) Any procedure may be used which can be demonstrated to produce a cooling rate in the test material which matches the cooling rate of the main body of the product at the region midway between midthickness and the surface ($\frac{1}{4}t$) and no nearer any heat treated edge than a distance equal to the nominal thickness t being quenched within 25°F and 20

sec at all temperatures after cooling begins from the austenitizing temperature.

(b) If cooling rate data for the material and cooling rate control devices for the test specimens are available, the test specimens may be heat treated in the device to represent the material, provided that the provisions of (a) above are met.

(c) When any of the specific procedures described in WB-2220 are used, faster cooling rates at the edges may be compensated for by:

- (1) taking the test specimens at least t from a quenched edge, where t equals the material thickness;
- (2) attaching a steel pad at least t wide by a partial penetration weld (which completely seals the buffered surface) to the edge where specimens are to be removed; or
- (3) using thermal barriers or insulation at the edge where specimens are to be removed.

It shall be demonstrated (and this information shall be included in the Certified Material Test Report) that the cooling rates are equivalent to (a) or (b) above.

WB-2220 PROCEDURE FOR OBTAINING TEST COUPONS AND SPECIMENS FOR QUENCHED AND TEMPERED MATERIAL

WB-2221 General Requirements

The procedure for obtaining test coupons and specimens for quenched and tempered material is related to the product form. Coupon and specimen location and the number of tension test specimens shall be in accordance with the material specifications, except as required by the following paragraphs. References to dimensions signify nominal values.

WB-2222 Plates

WB-2222.1 Number of Tension Test Coupons.

The number of tension test coupons required shall be in accordance with the material specification and with SA-20, except that from carbon steel plates weighing 42,000 lb and over and alloy steel plates weighing 40,000 lb and over, two tension test coupons shall be taken, one representing the top end of the plate and one representing the bottom end of the plate.

WB-2222.2 Orientation and Location of Coupons.

Coupons shall be taken so that specimens shall have their longitudinal axes at least $\frac{1}{4}t$ from a rolled surface and with the midlength of the specimen at least t from any heat treated edge, where t is the nominal thickness of the material.

WB-2222.3 Requirements for Separate Test Coupons.

Where a separate test coupon is used to represent the component material, it shall be of sufficient size to ensure that the cooling rate of the region from which the test coupons are removed represents the cooling rate of the material at least $\frac{1}{4}t$ deep and t from any edge of the product. Unless cooling rates applicable to the bulk pieces or product are simulated in accordance with WB-2212.2(b), the dimensions of the coupon shall be not less than $3t \times 3t \times t$, where t is the nominal material thickness.

WB-2223 Forgings

WB-2223.1 Location of Coupons.

Coupons shall be taken so that specimens shall have their longitudinal axes at least $\frac{1}{4}t$ from any surface and with the midlength of the specimens at least t from any second surface, where t is the maximum heat treated thickness. A thermal buffer as described in WB-2212.2(c) may be used to achieve these conditions, unless cooling rates applicable to the bulk forgings are simulated as otherwise provided in WB-2212.2.

WB-2223.2

Test coupons for forgings that are very thick or complex and other forgings that are contour shaped or machined to essentially the finished product configuration prior to heat treatment may be removed from prolongations or other stock provided on the product. The Certificate Holder shall specify the surfaces of the finished product subjected to high tensile stresses in service. The coupons shall be taken so that specimens shall have their longitudinal axes at a distance below the nearest heat treated surface, equivalent at least to the greatest distance that the indicated high tensile stress surface will be from the nearest surface during heat treatment, and with the midlength of the specimens a minimum of twice this distance from a second heat treated surface. In any case, the longitudinal axes of the specimens shall not be nearer than $\frac{3}{4}$ in. (19 mm) to any heat treated surface and the midlength of the specimens shall be

Page 75

at least $1\frac{1}{2}$ in. (38 mm) from any second heat treated surface.

WB-2223.3 Coupons From Separately Produced Test Forgings.

Test coupons representing forgings from one heat and one heat treatment lot may be taken from a separately forged piece under the conditions given in (a) through (e) below.

(a) The separate test forging shall be of the same heat of material and shall be subjected to substantially the same reduction and working as the production forging it represents.

(b) The separate test forging shall be heat treated in the same furnace charge and under the same conditions as the production forging.

(c) The separate test forging shall be of the same nominal thickness as the production forging.

(d) Test coupons for simple forgings shall be taken so that specimens shall have their longitudinal axes at the region midway between midthickness and the surface, and with the midlength of the specimens no nearer any heat treated edge than a distance equal to the forging thickness, except when the thickness-length ratio of the production forging does not permit, in which case a production forging shall be used as the test forging and the midlength of the specimens shall be at the midlength of the test forging.

(e) Test coupons for complex forgings shall be taken in accordance with WB-2223.2.

WB-2223.4 Test Specimens for Forgings.

When test specimens for forgings are to be taken under the applicable specification, the Inspector shall have the option of witnessing the selection, placing an identifying stamping on them, and witnessing the testing of these specimens.

WB-2224 Location of Coupons

(a) *Bars.* Coupons shall be taken so that specimens shall have their longitudinal axes at least $\frac{1}{4}t$ from the outside or rolled surface and with the midlength of the specimens at least t from a heat treated end, where t is either the bar diameter or thickness.

(b) *Bolting.* For bolting materials, tests shall be made of either full-size bolts or test coupons as required by the base specification. The gage length of the tension specimens and the area under the notch of Charpy specimens shall be at least one diameter or thickness from the heat treated end.

WB-2225 Tubular Products and Fittings

WB-2225.1 Location of Coupons.

Coupons shall be taken so that specimens shall have their longitudinal axes at least $\frac{1}{4}t$ from the inside or outside surface and with the midlength of the specimens at least t from a heat treated end, where t is the nominal wall thickness of the tubular product.

WB-2225.2 Separately Produced Coupons Representing Fittings.

Separately produced test coupons representing fittings may be used. When separately produced coupons are used, the requirements of WB-2223.3 shall be met.

WB-2226 Tensile Test Specimen Location (for Quenched and Tempered Ferritic Steel Castings)

NOTE: Users of this requirement should note that the hardenability of some grades may limit the usable section size.

(a) This section applies only to quenched and tempered ferritic steel castings with a thickness t exceeding 2 in. (51 mm) where t is the thickness of the pressure retaining wall of the casting, excluding flanges and sections designated by the designer as nonpressure-retaining. The order, inquiry, and drawing shall designate what the thickness t is for the casting.

(b) One of the following shall apply.

(1) The longitudinal centering of the thickness of the tension test specimen shall be taken at least $\frac{1}{4}t$ from the t dimension surface. For cylindrical castings, the longitudinal center line of the specimens shall be taken at least $\frac{1}{4}t$ from the outside or inside surface and the gage length at least t from the as-heat-treated end.

(2) Where separately cast test coupons are used, their dimensions shall be not less than $3t \times 3t \times t$ and each specimen cut from it shall meet the requirements of (b)(1) above. The test coupon shall be of the same heat of steel and shall receive substantially the same casting practices as the production casting it represents. (Centrifugal castings may be represented by statically cast coupons.) The test coupon shall be heat treated under the same conditions as the production casting(s). The t dimension of the test coupon shall be the same maximum thickness t as defined in (a) above. Where separate test blocks require reheat treatment, thermal buffers in accordance with (b)(1) above may be used.

(3) Where specimens are to be removed from the body of the casting, a steel, thermal buffer pad $1t \times 1t \times$ at least $3t$ shall be joined to the casting surface by a partial penetration weld completely sealing the buffered surface prior to the heat treatment process.

Page 76

The test specimens shall be removed from the casting in a location adjacent to the center third of the buffer pad. They shall be located at a minimum distance of $\frac{1}{2}$ in. (13 mm) from the buffered surface and $\frac{1}{4}t$ from the other heat treated surfaces.

(4) Where specimens are to be removed from the body of the casting, thermal insulation or other thermal barriers shall be used during the heat treatment process adjacent to the casting edge where specimens are to be removed. It shall be demonstrated that the cooling rate of the test specimen is no faster than that of specimens taken by the method described in (b)(1) above. This information shall be included in the test reports.

(5) Where castings are cast or machined to essentially the finished product configuration prior to heat treatment, the test specimens shall be removed from a casting prolongation or other stock on the product at a location below the nearest heat treated surface indicated on the order. The specimens shall be located with their longitudinal axes a distance below the nearest heat treated surface equivalent to at least the greatest distance that the indicated high tensile stress surface will be from the nearest heat treated surface and with their midlength a minimum of twice this distance from a second heat treated surface. In any case, the longitudinal axes of the test specimens shall be no nearer than $\frac{1}{4}$ in. (6 mm) to a heat treated surface and the midlength shall be at least $\frac{1}{2}$ in. (38 mm) from a second heat treated surface. The component manufacturer shall specify the surfaces of the finished product subjected to high tensile stress in service.

WB-2300 FRACTURE TOUGHNESS REQUIREMENTS FOR MATERIAL

WB-2310 MATERIAL TO BE TOUGHNESS TESTED

WB-2311 Material for Which Toughness Testing Is Required

(a) Containment system material and material welded thereto shall be toughness tested in accordance with the requirements of this Subarticle, except that the material listed in (1) through (7) below is not to be toughness tested as a requirement of this Division:

(1) material with a nominal section thickness of $\frac{3}{16}$ in. (4.8 mm) and less where the thicknesses shall be taken as

defined in (a) through (c) below:

(a) for containment vessels, use the nominal thickness of the shell or head, as applicable;

(b) for items welded to vessels, use the lesser of the vessel shell thickness to which the item is welded or the maximum radial thickness of the item exclusive of integral shell butt welding projections;

(c) for flat heads or flanges, use the maximum shell thickness associated with the butt welding hub;

(2) bolting, including studs, nuts, and bolts, with a nominal size of 1 in. (25 mm) and less;

(3) bars with a nominal cross-sectional area of 1 sq in. (645 mm²) and less;

(4) all thicknesses of material for valves and fittings with a NPS 6 (DN 150) diameter and smaller;

(5) material for valves and fittings with all pipe connections of $\frac{5}{8}$ in. (16 mm) nominal wall thickness and less;

(6) austenitic stainless steels;

(7) nonferrous material.

(b) Drop weight tests are not required for the martensitic high alloy chromium (Series 4XX) steels and precipitation hardening steels listed in Appendix 1. The other requirements of WB-2332 apply for these steels. For nominal wall thicknesses greater than $2\frac{1}{2}$ in. (64 mm), the required Charpy V-notch values shall be 40 mils (1.00 mm) lateral expansion.

WB-2320 IMPACT TEST PROCEDURES

WB-2321 Types of Tests

WB-2321.1 Drop Weight Tests.

The drop weight test, when required, shall be performed in accordance with ASTM E 208-91. Specimen types P-No. 1, P-No. 2, or P-No. 3 may be used. The results, orientation, and location of all tests performed to meet the requirements of WB-2330 shall be reported in the Certified Material Test Report.

WB-2321.2 Charpy V-Notch Tests.

The Charpy V-notch test (C_v), when required, shall be performed in accordance with SA-370. Specimens shall be in accordance with SA-370, Fig. 11, Type A. A test shall consist of a set of three full-size 10 mm × 10 mm specimens. The lateral expansion and absorbed energy, as applicable, and the test temperature, as well as the orientation and location of all tests performed to meet the requirements of WB-2330 shall be reported in the Certified Material Test Report.

WB-2321.3 Fracture Toughness Tests.

Fracture toughness tests, when required, shall be performed in accordance with ASTM E 399-83. The tests shall be

Page 77

performed at the lowest service temperature.² A test shall consist of two test specimens.

WB-2321.4 Dynamic Tear Test.

The dynamic tear tests, when required, shall be performed in accordance with ASTM E 604-83. The tests shall be performed at the lowest service temperature.² A test shall consist of two test specimens.

WB-2322 Test Specimens

WB-2322.1 Location of Test Specimens.

Toughness test specimens for quenched and tempered material shall be removed from the locations in each product form specified in WB-2220 for tensile test specimens. For material in other heat treated conditions, toughness test

specimens shall be removed from the locations specified for tensile test specimens in the material specification. For all material, the number of tests shall be in accordance with WB-2340. For bolting, the C_v toughness test specimen shall be taken with the longitudinal axis of the specimen located at least one-half radius or 1 in. (25 mm) below the surface plus the machining allowance per side, whichever is less. The fracture plane of the specimens shall be at least one diameter or thickness from the heat treated end. When the studs, nuts, or bolts are not of sufficient length, the midlength of the specimen shall be at the midlength of the studs, nuts, or bolts. The studs, nuts, or bolts selected to provide test coupon material shall be identical with respect to the quenched contour and size except for length, which shall equal or exceed the length of the represented studs, nuts, or bolts.

WB-2322.2 Orientation of Toughness Test Specimens

(a) Toughness test specimens shall be oriented as follows.

(1) Specimens for forgings, other than bolting and bars used for containment system components, shall be oriented in a direction normal to the principal direction in which the material was worked. Specimens are neither required nor prohibited from the thickness direction.

(2) Specimens from material for pipe, tube, and fittings, except for those made from plate and castings, shall be oriented in the axial direction.

(3) Specimens from bolting material and bars shall be oriented in the axial direction.

2 Lowest service temperature is the minimum metal temperature as detailed in the Design Specification.

(4) Specimens for all plate material, including that used for pipe, tube, and fittings, shall be oriented in a direction normal to the principal rolling direction, other than thickness direction.

(5) Specimens for cast material shall have their axes oriented the same as the axes of the tensile specimens (WB-2226).

(6) The plane of the toughness test specimen notch shall be normal to the surface of the material.

(b) Specimens for drop weight tests may have their axes oriented in any direction. The orientation used shall be reported in the Certified Material Test Report.

WB-2330 TEST REQUIREMENTS AND ACCEPTANCE STANDARDS³

WB-2331 Material for Containment Vessels

WB-2331.1 Test Requirements for Ferritic Steel Material for Containment Vessels

Ferritic steel material for containment vessels, other than bolting, shall be tested in accordance with (a) and (b), (c), or (d) below. Consideration shall be given to the test temperature requirements of leak testing and hydrostatic testing of the containment system (WB-6212).

(a) For material with a nominal section between $\frac{3}{16}$ in. (4.8 mm) and $\frac{5}{8}$ in. (16 mm) thick, the dynamic tear test shall exhibit at least 80% shear fracture at the lowest service temperature. For material of $\frac{5}{8}$ in. (16 mm) and more but not exceeding 12 in. (305 mm) thick, the reference temperature, RT_{NDT} , shall be established as follows:

(1) Determine a temperature T_{NDT} that is at or above the nil-ductility transition temperature by drop weight tests.

(2) At a temperature not greater than $T_{NDT} - 60^\circ\text{F}$ (16°C), each specimen of the C_v test (WB-2321.2) shall exhibit at least 35 mils (0.89 mm) lateral expansion and not less than 50 ft-lb (67.8 J) absorbed energy. Retesting in accordance with WB-2350 is permitted. When these requirements are met, T_{NDT} is the reference temperature RT_{NDT} .

(3) In the event that the requirements of (2) above are not met, conduct additional C_v tests in groups of three specimens (WB-2321.2) to determine the temperature T_c at which they are met. In this case the reference temperature $RT_{NDT} = T_c - 60^\circ\text{F}$. Thus, the reference temperature RT_{NDT} is the higher of T_{NDT} and $(T_c - 60^\circ\text{F})$.

3 In addition to providing a basis for acceptance standards for material, the test data are designated to be used as a basis for establishing inservice operation and for use in fracture prevention

(4) When a C_v test has not been performed at $T_{NDT} + 60^\circ\text{F}$, or when the C_v test at $T_{NDT} + 60^\circ\text{F}$, does not exhibit a minimum of 50 ft-lb and 35 mils lateral expansion, a temperature representing a minimum of 50 ft-lb and 35 mils lateral expansion may be obtained from a full C_v impact curve developed from the minimum data points of all the C_v tests performed.

(b) Apply the procedures of (a) above to (1), (2), and (3) below:

(1) the containment vessel and the closure system base materials;

(2) the base material, the heat affected zone, and weld metal from the weld procedure qualification tests in accordance with WB-4330;

(3) the weld metal of WB-2431.

(c) For materials where fracture toughness values are determined in accordance with WB-2321.3 the measured fracture toughness shall be reported in the Certified Material Test Report.

(d) Bars having a width or diameter of 2 in. (51 mm) and less which prohibit obtaining drop weight test specimens shall be tested in accordance with WB-2332.

WB-2331.2 Acceptance Standards for Ferritic Steel Material for Containment Vessels

Except as limited in WB-4330, the reference temperature RT_{NDT} shall be the highest value of the individual RT_{NDT} values determined in accordance with WB-2331.1(a) and (b). If applicable, the containment vessel and the closure system base materials shall be tested to determine the fracture toughness in accordance with WB-2321.3. The results shall meet the acceptance standards of either (a) or (b) below:

(a) For materials not exceeding 12 in. (305 mm), the reference temperature RT_{NDT} shall satisfy the value of A in accordance with Table WB-2331.2-1 where $A = LST - RT_{NDT}$ and LST is the Lowest Service Temperature.

(b) For materials not exceeding 4 in. (102 mm), the rapid-load fracture toughness of the base material shall satisfy the required value in Table WB-2331.2-2 and shall meet the additional requirements of (1) and (2) below:

(1) The RT_{NDT} of the heat affected zone and the weld metal shall be equal to or lower than the RT_{NDT} of the base material, and

(2) All full penetration fabrication weld joints are ultrasonically examined in accordance with WB-5110 and meet the ultrasonic acceptance standards of WB-5330.

(a) Rules for fracture toughness requirements based on fracture mechanics methodology are in preparation.

WB-2332 Material for Piping and Valves, Excluding Bolting Material

(a) Containment boundary material, other than bolting, with nominal wall thickness $2\frac{1}{2}$ in. (64 mm) and less for piping (pipe and tubes) and material for valves and fittings with all pipe connections of nominal wall thickness $2\frac{1}{2}$ in. (64 mm) and less shall be tested as required in (1) and (2) below.

(1) Test three C_v specimens at a temperature lower than or equal to the lowest service temperature. All three specimens shall meet the requirements of Table WB-2332(a)-1.

(2) Apply the procedures of (1) above to:

(a) the base material;

(b) the base material, the heat affected zone, and weld metal from the weld procedure qualification tests in accordance with WB-4330; and

(c) the weld metal of WB-2431.

TABLE WB-2332(a)-1 REQUIRED C_v VALUES FOR PIPING AND VALVES

**TABLE WB-2333-1
REQUIRED C_v VALUES FOR BOLTING MATERIAL**

Nominal Diameter, in.	Lateral Expansion, mils	Absorbed Energy, ft-lb
1 or less	No test required	No test required
Over 1 to 4, incl	25	No requirements
Over 4	25	45

TABLE WB-2333-1 REQUIRED C_v VALUES FOR BOLTING MATERIAL

(b) Pressure retaining material, other than bolting, with nominal wall thickness over $2\frac{1}{2}$ in. (64 mm) for piping (pipe and tubes) and material for valves, and fittings with any pipe connections of nominal wall thickness greater than $2\frac{1}{2}$ in. (64 mm) shall meet the requirements of WB-2331. The lowest service temperature shall not be lower than $RT_{NDT} + 100^\circ\text{F}$.

WB-2333 Bolting Material

For bolting material, including studs, nuts, and bolts, test three C_v specimens at a temperature no higher than the preload temperature or the lowest service temperature, whichever is less. All three specimens shall meet the requirements of Table WB-2333-1.

WB-2340 NUMBER OF TOUGHNESS TESTS REQUIRED

WB-2341 Plates

One test shall be made from each plate as heat treated. Where plates are furnished in the unheat-treated condition and qualified by heat treated test specimens, one test shall be made for each plate as-rolled. The term *as-rolled* refers to the plate rolled from a slab or directly from an ingot, not to its heat treated condition.

WB-2342 Forgings and Castings

(a) Where the weight of an individual forging or casting is less than 1,000 lb (454 kg), one test shall be made to represent each heat in each heat treatment lot.

(b) When heat treatment is performed in a continuous type furnace with suitable temperature controls and equipped with recording pyrometers so that complete heat treatment records are available, a heat treatment charge shall be considered as the lesser of a continuous run not exceeding 8 hr duration or a total weight, so treated, not exceeding 2,000 lb (907 kg).

(c) One test shall be made for each forging or casting of 1,000 lb to 10,000 lb (454 kg to 4,540 kg) in weight.

(d) As an alternative to (c), a separate test forging or casting may be used to represent forgings or castings of different sizes in one heat and heat treat lot, provided the test piece is a representation of the greatest thickness in the heat treat lot.

WB-2343 Bars

One test shall be made for each lot of bars with cross-sectional area greater than 1 sq in. (645 mm²), where a lot is defined as one heat of material heat treated in one charge or as one continuous operation, not to exceed 6,000 lb.

WB-2344 Tubular Products and Fittings

On products which are seamless or welded without filler metal, one test shall be made from each lot. On products which are welded with filler metal, one additional test with the specimens taken from the weld area shall also be made on each lot. A lot shall be defined as stated in the applicable material specification, but in no case shall a lot consist of products from more than one heat of material and of more than one diameter, with the nominal thickness of any product included not exceeding that to be tested by more than $\frac{1}{4}$ in. (6 mm); such a lot shall be in a single heat treatment load or in the same continuous run in a continuous furnace controlled within a 50°F (28°C) range and equipped with recording pyrometers.

WB-2345 Bolting Material

One test shall be made for each lot of material, where a lot is defined as one heat of material heat

Page 80

treated in one charge or as one continuous operation, not to exceed in weight the following:

$1\frac{3}{4}$ in. diameter and less	1,500 lb
Over $1\frac{3}{4}$ in. to $2\frac{1}{2}$ in. diameter	3,000 lb
Over $2\frac{1}{2}$ in. to 5 in. diameter	6,000 lb
Over 5 in. diameter	10,000 lb

WB-2346 Test Definitions

Unless otherwise stated in WB-2341 through WB-2345, the term *one test* is defined to include the combination of the drop weight test and the C_v test when RT_{NDT} is required [WB-2331.1(a) and WB-2331.1(b)] or only the C_v test or the fracture toughness test when RT_{NDT} is not required [WB-2331.1(c) and WB-2331.1(d)].

WB-2350 RETESTS

(a) For C_v tests required by WB-2330, one retest at the same temperature may be conducted provided the requirements of (1) through (3) below are met:

(1) the average value of the test results meets the minimum requirements;

(2) not more than one specimen per test is below the minimum requirements;

(3) the specimen not meeting the minimum requirements is not lower than 10 ft-lb or 5 mils below the specified requirements.

(b) A retest consists of two additional specimens taken as near as practicable to the failed specimens. For acceptance of the retest, both specimens shall meet the minimum requirements.

WB-2360 CALIBRATION OF INSTRUMENTS AND EQUIPMENT

Calibration of temperature instruments and test machines used in toughness testing shall be performed at the frequency given in (a) and (b) below.

(a) Temperature instruments used to control test temperature of specimens shall be calibrated and the results recorded to meet the requirements of WA-3858.2 at least once in each 3 month interval.

(b) Test machines shall be calibrated at least once per year and the results recorded using methods outlined in ASTM E 23

-72 and employing standard specimens obtained from the National Institute of Standards and Technology.

WB-2400 WELDING AND BRAZING MATERIAL

WB-2410 GENERAL REQUIREMENTS

(a) All welding material used in the construction and repair of components or material, except welding material used for cladding or hard surfacing, shall conform to the requirements of the welding material specification or to the requirements for other welding material as permitted in Section IX. In addition, welding material shall conform to the requirements stated in this Subarticle and to the rules covering identification in WB-2150.

(b) The Certificate Holder shall provide the organization performing the testing with the information listed below, as applicable.

- (1) welding process;
- (2) SFA Specification and classification;
- (3) other identification if no SFA Specification applies;
- (4) minimum tensile strength [WB-2431.1(e)] in the as-welded or heat treated condition or both [WB-2431.1(c)];
- (5) drop weight test for material as-welded or heat treated, or both (WB-2331);
- (6) Charpy V-notch test for material as-welded or heat treated, or both (WB-2331); the test temperature and the lateral expansion or the absorbed energy shall be provided;
- (7) Fracture toughness test for material as-welded or heat treated, or both (WB-2331);
- (8) the preheat and interpass temperatures to be used during welding of the test coupon [WB-2431.1(c)];
- (9) postweld heat treatment time, temperature range, and maximum cooling rate, if the production weld will be heat treated [WB-2431.1(c)];
- (10) elements for which chemical analysis is required per the SFA Specification or Welding Procedure Specification and WB-2432;
- (11) minimum delta ferrite (WB-2433).

WB-2420 REQUIRED TESTS

The required tests shall be conducted for each lot of covered, flux cored, or fabricated electrodes; for each heat of bare electrodes, rod, or wire for use with the OFW, GMAW, GTAW, PAW, and EGW (electrogas welding) processes (Section IX, QW-492); for each heat of consumable inserts; for each combination of heat of bare electrodes and lot of submerged arc flux (SAW); for each combination of lot of fabricated electrodes and lot of submerged arc flux; for each

Page 81

combination of heat of bare electrodes or lot of fabricated electrodes, and dry blend of supplementary powdered filler metal, and lot of submerged arc flux; or for each combination of heat of bare electrodes and lot of electrosag flux (ESW). Tests performed on welding material in the qualification of weld procedures will satisfy the testing requirements for the lot, heat, or combination of heat and batch of welding material used, provided the tests required by WB-4000 and this Subarticle are made and the results conform to the requirements of this Article. The definitions in (a) through (h) below apply.

(a) A *dry batch of covering mixture* is defined as the quantity of dry covering ingredients mixed at one time in one mixing vessel; a dry batch may be used singly or may be subsequently subdivided into quantities to which the liquid binders may be added to produce a number of wet mixes [(c) below].

(b) A *dry blend* is defined as one or more dry batches mixed in a mixing vessel and combined proportionately to produce a uniformity of mixed ingredients equal to that obtained by mixing the same total amount of dry ingredients at one time in one mixing vessel.

(c) A *wet mix* is defined as the combination of a dry batch or dry blend [(a) and (b) above, respectively], and liquid binder

ingredients at one time in one mixing vessel.

(d) A *lot of covered, flux cored, or fabricated electrodes* is defined as the quantity of electrodes produced from the same combination of heat of metal and dry batch, dry blend, or chemically controlled mixes of flux or core materials. Alternatively, a lot of covered, flux cored, or fabricated electrodes may be considered one type and size of electrode, produced in a continuous period, not to exceed 24 hr and not to exceed 100,000 lb, from chemically controlled tube, wire, or strip and a dry batch, a dry blend, or chemically controlled mixes of flux, provided each container of welding material is coded for identification and traceable to the production period, the shift, line, and the analysis range of both the mix and the rod, tube, or strip used to make the electrode.

(1) *Chemically controlled tube, wire, or strip* is defined as consumable tube, wire, or strip material supplied on coils with a maximum of one splice per coil that has been chemically analyzed to ensure that the material conforms to the electrode manufacturer's chemical control limits for the specific type of electrode. Both ends of each coil shall be chemically analyzed, except that those coils which are splice free need only be analyzed on one end of the coil.

(2) *Chemically controlled mixes of flux* are defined as flux material that has been chemically analyzed to ensure that it conforms to the percent allowable variation from the electrode manufacturer's standard for each chemical element for that type electrode. A chemical analysis shall be made on each mix made in an individual mixing vessel after blending.

(e) A *heat of bare electrode, rod, wire, or consumable insert* is defined as the material produced from the same melt of metal.

(f) Alternatively, for carbon and low alloy steel bare electrode, rod, wire, or consumable inserts for use with SAW, OFW, GMAW, GTAW, PAW, and EGW processes, a *heat* may be defined as either the material produced from the same melt of metal or the material produced from one type and size of wire when produced in a continuous period [not to exceed 24 hr and not to exceed 100,000 lb (45,360 kg)] from chemically controlled wire, subject to requirements of (1), (2), and (3) below.

(1) For the chemical control of the product of the rod mill, coils shall be limited to a maximum of one splice prior to processing the wire. Chemical analysis shall be made from a sample taken from both ends of each coil of mill coiled rod furnished by mills permitting spliced coil practice of one splice maximum per coil. A chemical analysis need be taken from only one end of rod coils furnished by mills prohibiting spliced coil practice.

(2) Carbon, manganese, silicon, and other intentionally added elements shall be identified to ensure that the material conforms to the SFA or user's material specification.

(3) Each container of wire shall be coded for identification and traceability to the lot, production period, shift, line, and analysis of rod used to make the wire.

(g) A *lot of submerged arc or electroslag flux* is defined as the quantity of flux produced from the same combination of raw materials under one production schedule.

(h) A *dry blend of supplementary powdered filler metal* is defined as one or more mixes of material produced in a continuous period, not to exceed 24 hr and not to exceed 20,000 lb (9,070 kg) from chemically controlled mixes of powdered filler metal, provided each container of powdered metal is coded for identification and traceable to the production period, the shift, and the mixing vessel. A *chemically controlled mix of powdered filler metal* is defined as powdered filler metal material that has been chemically analyzed to assure that it conforms to the percent allowable variation from the powdered filler metal manufacturer's standard, for each chemical element, for that type of powdered filler metal. A chemical analysis shall be made on each

Page 82

mix made in an individual mixing vessel after blending. The chemical analysis range of the supplemental powdered filler shall be the same as that of the welding electrode, and the ratio of powder to electrode used to make the test coupon shall be the maximum permitted for production welding.

WB-2430 WELD METAL TESTS

WB-2431 Mechanical Properties Test

Tensile and toughness tests shall be made, in accordance with this paragraph, of welding materials which are used to join P-Nos. 1, 3, 4, 5, 6, 7, 9, and 11 base materials in any combination, with the exceptions listed in (a) through (d) below:

- (a) austenitic stainless steel and nonferrous welding material used to join the listed P-Numbers;
- (b) consumable inserts (backing filler material);
- (c) welding material used for GTAW root deposits with a maximum of two layers;
- (d) welding material to be used for the welding of base material exempted from toughness testing by WB-2311 shall likewise be exempted from the impact testing required by WB-2330 and this paragraph.

WB-2431.1 General Test Requirements.

The welding test coupon shall be made in accordance with (a) through (f) below, using each process with which the weld material will be used in production welding.

- (a) Test coupons shall be of sufficient size and thickness such that the test specimens required herein can be removed.
- (b) The weld metal to be tested for all processes except electroslag welding shall be deposited in such a manner as to eliminate substantially the influence of the base material on the results of the tests. Weld metal to be used with the electroslag process shall be deposited in such a manner as to conform to one of the applicable Welding Procedure Specifications (WPS) for production welding, Section IX, QW-200.1. The base material shall conform to the requirements of Section IX, QW-403.1 or QW-403.4, as applicable.
- (c) The welding of the test coupon shall be performed within the range of preheat and interpass temperatures that will be used in production welding. Coupons shall be tested in the as-welded condition, or they shall be tested in the applicable postweld heat treated condition when the production welds are to be postweld heat treated. The postweld heat treatment holding time shall be at least 80% of the maximum time to the weld metal in production application. The total time for postweld heat treatment of the test coupon may be applied in one heating cycle. The cooling rate from the postweld heat treatment temperature shall be of the same order as that applicable to the weld metal in the component. In addition, weld coupons for weld metal to be used with the electroslag process, which are tested in the as-welded condition or following a postweld heat treatment within the holding temperature ranges of Tables WB-4622.1-1 or WB-4622.4(c)-1, shall have a thickness within the range of 0.5 to 1.1 times the thickness of the welds to be made in production. Electroslag weld coupons to be tested following a postweld heat treatment, which will include heating the coupon to a temperature above the Holding Temperature Range of Table WB-4622.1-1 for the type of material being tested, shall have a thickness within the range of 0.9 to 1.1 times the thickness of the welds to be made in production.
- (d) Regardless of the welding process or welding material being tested, the tensile specimens, and the C_v test specimens where required, shall be located and prepared in accordance with the requirements of SFA-5.1, Specification for Mild Steel Covered Electrodes. Drop weight and fracture toughness test specimens, where required, shall be oriented so that the longitudinal axis is transverse to the weld with the notch in the weld face or in a plane parallel to the weld face. For specimen preparation and testing, the applicable parts of WB-2321.1 and WB-2321.2 shall apply. The longitudinal axis of the specimen shall be at a minimum depth of $1/4t$ from a surface, where t is the thickness of the test weld.
- (e) One all weld metal tensile specimen shall be tested and shall meet the specified minimum tensile strength requirements of the base material specification. When base materials of different specifications are to be welded, the tensile strength requirements shall conform to the specified minimum tensile strength requirements of either of the base material specifications.
- (f) Toughness specimens of the weld metal shall be tested where toughness tests are required for either of the base materials of the production weld. The weld metal shall conform to the parts of WB-2331(a) or WB-2332 applicable to the base material. Where different requirements exist for the two base materials, the weld metal may conform to either of the two requirements.

WB-2431.2 Standard Test Requirements.

In lieu of the use of the General Test Requirements specified in WB-2431.1, tensile and toughness tests may be made in accordance with this subparagraph where they are required for mild and low alloy steel covered electrodes; the

Standard Test Requirements option. The limitations and testing under this Standard Test option shall be in accordance with (a) through (f) below.

(a) Testing to the requirements of this subparagraph shall be limited to electrode classifications included in Specifications SFA-5.1 or SFA-5.5.

(b) The test assembly required by SFA-5.1 or SFA-5.5, as applicable, shall be used for test coupon preparation, except that it shall be increased in size to obtain the number of C_v specimens, drop weight specimens, and fracture toughness test specimens required by WB-2330, where applicable.

(c) The welding of the test coupon shall conform to the requirements of the SFA Specification for the classification of electrode being tested. Coupons shall be tested in the as-welded condition and also in the postweld heat treated condition. The PWHT temperatures shall be in accordance with Table WB-4622.1-1 for the applicable P-Number equivalent. The time at PWHT temperature shall be 8 hr. (This qualifies PWHT of 10 hr or less.) When the PWHT of the production weld exceeds 10 hr, or the PWHT temperature is other than that required above, the general test of WB-2431.1 shall be used.

(d) The tensile and C_v specimens shall be located and prepared in accordance with the requirements of SFA-5.1 or SFA-5.5, as applicable. Drop weight and fracture toughness test specimens, where required, shall be located and oriented as specified in WB-2431.1(d).

(e) One all weld metal tensile specimen shall be tested and shall meet the specified minimum tensile strength requirement of the SFA Specification for the applicable electrode classification.

(f) The requirements of WB-2431.1(f) shall be applicable to the toughness testing of this option.

WB-2432 Chemical Analysis Test

Chemical analysis of filler metal or weld deposits shall be made in accordance with WB-2420 and as required by the following subparagraphs.

WB-2432.1 Test Method.

The chemical analysis test shall be performed in accordance with this subparagraph and Table WB-2432.1-1, and the results shall conform to WB-2432.2.

(a) A-No. 8 welding material to be used with GTAW and PAW processes and any other welding material to be used with any GTAW, PAW, or GMAW process shall have chemical analysis performed either on the filler metal or on a weld deposit made with the filler metal in accordance with (c) or (d) below.

**TABLE WB-2432.1-1
SAMPLING OF WELDING MATERIALS FOR
CHEMICAL ANALYSIS**

	GTAW/PAW	GMAW	All Other Processes
A-No. 8 filler metal	Filler metal or weld deposit	Weld deposit	Weld deposit
All other filler metal	Filler metal or weld deposit	Filler metal or weld deposit	Weld deposit

TABLE WB-2432.1-1 SAMPLING OF WELDING MATERIALS FOR CHEMICAL ANALYSIS

(b) A-No. 8 welding material to be used with other than the GTAW and PAW processes and other welding material to be used with other than the GTAW, PAW, or GMAW process shall have chemical analysis performed on a weld deposit of the material or combination of materials being certified in accordance with (c) or (d) below. The removal of chemical analysis samples shall be from an undiluted weld deposit made in accordance with (c) below. As an alternative, the deposit shall be made in accordance with (d) below for material that will be used for corrosion resistant overlay cladding. Where the Welding Procedure Specification or the welding material specification specifies percentage composition limits for analysis, it shall state that the specified limits apply for the filler metal analysis, the undiluted weld deposit analysis, or *in situ* cladding deposit analysis in conformance with the above required certification testing.

4 The methods given in the Appendix of SFA-5.9, Specification for Corrosion Resisting Chromium and Chromium-Nickel Steel Welding Rods and Bare Electrodes, shall be used to establish a welding and sampling method for the pad, groove, or other test weld to ensure that the weld deposit being sampled will be substantially free of base metal dilution.

(c) The preparation of samples for chemical analysis of undiluted weld deposits shall comply with the method given in the applicable SFA Specification. Where a weld deposit method is not provided by the SFA specification, the sample shall be removed from a weld pad, groove, or other test weld⁴ made using the welding process that will be followed when the welding material or combination of welding materials being certified is consumed. The weld for A-No. 8 material to be used with the GMAW or EGW process shall be made using the shielding gas composition specified in the Welding Procedure Specifications that will be followed when the material is consumed. The test sample for ESW

Page 84

shall be removed from the weld metal of the mechanical properties test coupon. Where a chemical analysis is required for a welding material which does not have a mechanical properties test requirement, a chemical analysis test coupon shall be prepared as required by WB-2431.1(c), except that heat treatment of the coupon is not required and the weld coupon thickness requirements of WB-2431.1(c) do not apply.

Chromium–Nickel stainless steels	C, Cr, Mo, Ni, Mn, Si, Cb + Ta
---	---------------------------------------

TABLE WB-2432.2(a)-2 CHEMICAL ANALYSIS FOR WELDING MATERIAL FOR OTHER THAN REACTOR VESSEL WELDS

(d) The alternative method provided in (b) above for the preparation of samples for chemical analysis of welding material to be used for corrosion resistant overlay cladding shall require a test weld made in accordance with the essential variables of the Welding Procedure Specification that will be followed when the welding material is consumed. The test weld shall be made in conformance with the requirements of Section IX, QW-214.1. The removal of chemical analysis samples shall conform with QW-453 for the minimum thickness for which the welding procedure specification is qualified.

[98]

WB-2432.2 Requirements for Chemical Analysis.

The chemical elements to be determined, the composition requirements of the weld metal, and the recording of results of the chemical analysis shall be in accordance with (a) through (c) below.

(a)(1) All welding material to be used in the reactor vessel shall be analyzed for the elements listed in Table WB-2432.2(a)-1.

(2) All welding material of ferrous alloys A-No. 8 and A-No. 9 (Section IX, QW-442) to be used in other components shall be analyzed for the elements listed in Table WB-2432.2(a)-2 and for any other elements specified in the welding material specification referenced by the WPS or in the WPS.

(3) All other welding material shall be analyzed for the elements specified in either the welding material specification referenced by the WPS or in the WPS.

(b) The chemical composition of the weld metal or filler metal shall conform to the welding material specification for elements having specified percentage composition limits. Where the Welding Procedure Specification contains a modification of the composition limits of SFA or other referenced welding material specifications, or provides limits for additional elements, these composition limits of the welding procedure specification shall apply for acceptability.

(c) The results of the chemical analysis shall be reported. Elements listed in Table WB-2432.2(a)-1 or Table WB-2432.2(a)-2 but not specified in the welding material specification or WPS shall be reported for information only.

[98]

WB-2433 Delta Ferrite Determination

A determination of delta ferrite shall be performed on A-No. 8 weld material (Section IX, QW-442) backing filler metal (consumable inserts); bare electrode, rod, or wire filler metal; or weld metal, except that delta ferrite determinations are not required for SFA-5.9 and SFA-5.4, Type 16-8-2, or A-No. 8 weld filler metal to be used for weld metal cladding.

WB-2433.1 Method.

Delta ferrite determinations of welding material, including consumable insert material, shall be made using a magnetic measuring instrument and weld deposits made in accordance with (b) below. Alternatively, the delta ferrite determinations for welding materials may be performed by the use of chemical analysis of WB-2432 in conjunction with Fig. WB-2433.1-1.

(a) Calibration of magnetic instruments shall conform to AWS-A4.2-91.

(b) The weld deposit for magnetic delta ferrite determination shall be made in accordance with WB-2432.1(c).

(c) A minimum of six ferrite readings shall be taken on the surface of the weld deposit. The readings obtained shall be averaged to a single Ferrite Number (FN).

WB-2433.2 Acceptance Standards.

The minimum acceptable delta ferrite shall be 5FN. The results of the delta ferrite determination shall be included in the Certified Material Test Report of WB-2130 or WB-4120.

Page 85

Page 86

GENERAL NOTES:

(a) The actual nitrogen content is preferred. If this is not available, the following applicable nitrogen value shall be used:

(1) GMAW welds - 0.08%, except that when self shielding flux cored electrodes are used - 0.12%.

(2) Welds made using other processes - 0.06%.

(b) This diagram is identical to the WRC-1992 Diagram, except that the solidification mode lines have been removed for ease of use.

FIG. WB-2433.1-1 WELD METAL DELTA FERRITE CONTENT

FIG. WB-2433.1-1 WELD METAL DELTA FERRITE CONTENT

WB-2440 STORAGE AND HANDLING OF WELDING MATERIAL

Suitable storage and handling of electrodes, flux, and other welding material shall be maintained. Precautions shall be taken to minimize absorption of moisture by fluxes and cored, fabricated, and coated electrodes.

WB-2450 BRAZING MATERIAL

Brazing filler material and fluxes shall conform to the rules covering identification in WB-2150 and to the requirement of (a), (b), and (c) below.

(a) The filler material used in brazing shall be a nonferrous metal or alloy with a solidus temperature about 800°F (427°C) and at least 500°F (278°C) above the highest temperature of the joint in service.

(b) The filler material shall melt and flow freely by capillary action within the desired temperature range, and, in conjunction with a suitable flux or controlled atmosphere, the filler material shall wet and adhere to the surfaces to be joined.

(c) Fluxes that are fluid and chemically active at the brazing temperature shall be used, when necessary, to prevent oxidation of the filler metal and the surfaces to be joined and to promote free flowing of the filler material.

WB-2500 EXAMINATION AND REPAIR OF CONTAINMENT SYSTEM MATERIAL

WB-2510 EXAMINATION OF CONTAINMENT SYSTEM MATERIAL

(a) Containment system material and material welded thereto shall be examined by nondestructive methods applicable to the material and product form as required by the rules of this Subarticle. Seamless pipe, tubes, and fittings, and less, need not be examined by the rules of this Subarticle.

(b) The requirements of this Subarticle for repair by welding, including examination of the repair welds, shall be met wherever repair welds are made to containment system material and material welded thereto. The exceptions in (a) above do not apply to repair welds.

WB-2520 EXAMINATION AFTER QUENCHING AND TEMPERING

Ferritic steel products that have their properties enhanced by quenching and tempering shall be examined by the methods specified in this Subarticle for each product form after the quenching and tempering phase of the heat treatment.

WB-2530 EXAMINATION AND REPAIR OF PLATE

WB-2531 Required Examination

All plates 2 in. (51 mm) nominal thickness and less shall be examined by the angle beam ultrasonic method in accordance with WB-2532.2. All plates greater than 2 in. (51 mm) thickness shall be examined by the straight beam ultrasonic method in accordance with WB-2532.1.

WB-2532 Examination Procedures

WB-2532.1 Straight Beam Examination.

The requirements for straight beam examination shall be in accordance with SA-578, Specification for Straight Beam Wave Ultrasonic Testing and Inspection of Plain and Clad Steel Plates for Special Applications, as shown in Section V, except that the extent of examination and the acceptance standards to be applied are given in (a) and (b) below.

(a) *Extent of Examination.* One hundred percent of one major plate surface shall be covered by moving the search unit in parallel paths with not less than a 10% overlap.

(b) *Acceptance Standards*

(1) Any area where one or more imperfections produce a continuous total loss of back reflection accompanied by continuous indications on the same plane that cannot be encompassed within a circle whose diameter is 3 in. (76 mm) or one-half of the plate thickness, whichever is greater, is unacceptable.

(2) In addition, two or more imperfections smaller than described in (1) above shall be unacceptable unless separated by a minimum distance equal to the greatest diameter of the larger imperfection, or unless they may be collectively encompassed by the circle described in (1) above.

WB-2532.2 Angle Beam Examination.

The requirements for angle beam examination shall be in accordance with SA-577, Specification for Ultrasonic Beam Wave Inspection of Steel Plates, as shown in Section V and supplemented by (a) and (b) below. The calibration

Page 87

notch, extent of examination, and acceptance standards to be applied are given in (a) through (c) below.

(a) *Calibration.* Angle beam examination shall be calibrated from a notch.

(b) *Extent of Examination.* One hundred percent of one major plate surface shall be covered by moving the search unit in parallel paths with not less than 10% overlap.

(c) *Acceptance Standards.* Material that shows one or more imperfections which produce indications exceeding in amplitude the indication from the calibration notch is unacceptable unless additional exploration by the straight beam method shows the imperfections are laminar in nature and are acceptable in accordance with WB-2532.1(b).

WB-2537 Time of Examination

Acceptance examinations shall be performed at the time of manufacture as required in (a) through (c) below.

(a) *Ultrasonic examination* shall be performed after rolling to size and after heat treatment, except for postweld heat treatment.

(b) *Radiographic examination* of repair welds, when required, may be performed prior to any required postweld heat treatment.

(c) *Magnetic particle or liquid penetrant examination* of repair welds shall be performed after final heat treatment, except that the examination may be performed prior to postweld heat treatment of P-No.1 material 2 in. (51 mm) and less nominal thickness.

WB-2538 Elimination of Surface Defects

Surface defects shall be removed by grinding or machining, provided the requirements of (a) through (d) below are met.

(a) The depression, after defect elimination, is blended uniformly into the surrounding surface.

(b) After defect elimination, the area is examined by the magnetic particle method in accordance with WB-2545 or the liquid penetrant method in accordance with WB-2546 to ensure that the defect has been removed or reduced to an imperfection of acceptable size.

(c) Areas ground to remove oxide scale or other mechanically caused impressions for appearance or to facilitate proper ultrasonic testing need not be examined by the magnetic particle or liquid penetrant test method.

(d) When the elimination of the defect reduces the thickness of the section below the minimum required to satisfy WB-3000, the product shall be repaired in accordance with WB-2539.

WB-2539 Repair by Welding

The Material Organization may repair by welding material from which defects have been removed, provided the depth of the repair cavity does not exceed one-third the nominal thickness and the requirements of the following subparagraphs are met. Prior approval of the Certificate Holder shall be obtained for the repair of plates to be used in the manufacture of containment systems.

WB-2539.1 Defect Removal.

The defect shall be removed by suitable mechanical or thermal cutting or gouging methods and the cavity prepared for

repair (WB-4211.1).

WB-2539.2 Qualification of Welding Procedures and Welders.

The welding procedure and welders or welding operators shall be qualified in accordance with WB-4000 and Section IX.

WB-2539.3 Blending of Repaired Areas.

After repair, the surface shall be blended uniformly into the surrounding surface.

WB-2539.4 Examination of Repair Welds.

Each repair weld shall be examined by the magnetic particle method (WB-2545) or by the liquid penetrant method (WB-2546). In addition, when the depth of the repair cavity exceeds the lesser of $\frac{3}{8}$ in. (10 mm) or 10% of the section thickness, the repair weld shall be radiographed after repair in accordance with WB-5110 and to the acceptance standards of WB-5320. The penetrometer and the acceptance standards for radiographic examination of repair welds shall be based on the section thickness at the repair area.

WB-2539.5 Heat Treatment After Repairs.

The product shall be heat treated after repair in accordance with the heat treatment requirements of WB-4620.

WB-2539.6 Material Report Describing Defects and Repairs.

Each defect repair exceeding in depth the lesser of $\frac{3}{8}$ in. (10 mm) or 10% of the section thickness shall be described in the Certified Material Test Report. The Certified Material Test Report for each piece shall include a chart which shows the location and size of the prepared cavity, the welding material identification, the welding procedure, the heat treatment, and the examination results, including radiographic film.

Page 88

WB-2539.7 Repair of Cladding by Welding.

The Material Organization may repair defects in cladding by welding, provided the requirements of (a) through (d) below are met.

(a) *Qualification of Welding Procedures and Welders.* The welding procedure and the welders or welding operators shall be qualified in accordance with WB-4000 and with Section IX.

(b) *Defect Removal and Examination of Cavity.* The defect shall be removed, and the cavity prepared for repair shall be examined by the liquid penetrant method (WB-2546).

(c) *Examination of Repaired Areas.* The repaired area shall be examined by a liquid penetrant method (WB-2546).

(d) *Report of Repairs.* Each defect repair shall be described in the Certified Material Test Report for each piece, including a chart which shows the location and size of the repair, the welding material identification, welding procedure, heat treatment, and examination results.

WB-2540 EXAMINATION AND REPAIR OF FORGINGS AND BARS

WB-2541 Required Examinations

(a) Forgings and bars shall be examined by the ultrasonic method in accordance with WB-2542, except forgings or sections of forgings which have coarse grains, or configurations which do not yield meaningful examination results by ultrasonic methods, shall be examined by radiographic methods in accordance with Section V, Article 2, using the acceptance standards of WB-5320. In addition, all external surfaces and accessible internal surfaces shall be examined by a magnetic particle method (WB-2545) or a liquid penetrant method (WB-2546).

(b) Forged flanges and fittings, such as elbows, tees, and couplings, shall be examined in accordance with the requirements of WB-2550.

(c) Bar material used for bolting shall be examined in accordance with WB-2580.

(d) Forgings and forged or rolled bars which are to be bored to form tubular products or fittings shall be examined in accordance with the requirements of WB-2550 after boring.

(e) Forgings and forged or rolled bars which will subsequently be bored to form valve parts shall be examined in accordance with WB-2541 after boring.

WB-2542 Ultrasonic Examination

WB-2542.1 Examination Procedure.

All forgings in the rough-forged or finished condition, and bars, shall be examined in accordance with Article 5 of Section V and the following supplemental requirements. The techniques of (a) through (d) below are required, as applicable.

(a) Forgings may be examined by the use of alternative ultrasonic methods which utilize distance amplitude corrections, provided the acceptance standards are shown to be equivalent to those listed in WB-2542.2.

(b) Cylindrical section bars shall be scanned from the entire external circumference.

(c) Noncylindrical section bars shall be scanned in two perpendicular directions to the maximum extent possible (through each pair of parallel sides).

(d) Bar products do not require recording and reporting of indications smaller than the acceptance standard, except when so specified for specialized applications.

WB-2542.2 Acceptance Standards

(a) *Straight Beam General Rule.* A forging shall be unacceptable if the results of straight beam examinations show one or more reflectors which produce indications accompanied by a complete loss of back reflection not associated with or attributable to geometric configurations. Complete loss of back reflection is assumed when the back reflection falls below 5% of full calibration screen height.

(b) *Straight Beam Special Rule for Vessel Shell Sections*

(1) A ring forging made to fine grain melting practice and used for vessel shell sections shall be unacceptable if the results of the straight beam radial examination show one or more reflectors producing a continuous complete loss of back reflection accompanied by continuous indications on the same plane that cannot be encompassed with a circle whose diameter is 3 in. (76 mm) or one-half of the wall thickness, whichever is greater.

(2) In addition, two or more reflectors smaller than described in (1) above shall be unacceptable unless separated by a minimum distance equal to the greatest diameter of the larger reflector or unless they may be collectively encompassed by the circle described in (1) above.

(c) *Angle Beam Rule.* A forging shall be unacceptable if the results of angle beam examinations show one or more reflectors which produce indications exceeding in amplitude the indication from the appropriate calibration notches.

Page 89

WB-2545 Magnetic Particle Examination

WB-2545.1 Examination Procedure.

The procedure for magnetic particle examination shall be in accordance with the methods of Article 7, Section V.

WB-2545.2 Evaluation of Indications

(a)

(a) Mechanical discontinuities at the surface are revealed by the retention of the examination medium. All indications are not necessarily defects, however, since certain metallurgical discontinuities and magnetic permeability variations may produce similar indications which are not relevant.

(b) Any indication in excess of the WB-2545.3 acceptance standards, which is believed to be nonrelevant, shall be recommended by the same or other nondestructive examination methods to verify whether or not actual defects are present. Surface conditioning may precede the reexamination. Nonrelevant indications which would mask defects are unacceptable.

(c) Relevant indications are indications which result from imperfections. Linear indications are indications in which the length is more than three times the width. Rounded indications are indications which are circular or elliptical with the length equal to or less than three times the width.

WB-2545.3 Acceptance Standards

(a) Only imperfections producing indications with major dimensions greater than $\frac{1}{16}$ in. (1.6 mm) shall be considered relevant imperfections.

(b) Imperfections producing the following indications are unacceptable:

(1) any linear indications greater than $\frac{1}{16}$ in. (1.6 mm) long for material less than $\frac{5}{8}$ in. (16 mm) thick, greater than $\frac{1}{8}$ in. (3.2 mm) long for material from $\frac{5}{8}$ in. (16 mm) thick to under 2 in. (51 mm) thick, and $\frac{3}{16}$ in. (4.8 mm) long for material 2 in. (51 mm) thick and greater;

(2) rounded indications with dimensions greater than $\frac{1}{8}$ in. (3.2 mm) for thicknesses less than $\frac{5}{8}$ in. (16 mm) and greater than $\frac{3}{16}$ in. (4.8 mm) for thicknesses $\frac{5}{8}$ in. (16 mm) and greater;

(3) four or more indications in a line separated by $\frac{1}{16}$ in. (1.6 mm) or less edge to edge;

(4) ten or more indications in any 6 sq in. (3,871 mm²) of area whose major dimension is no more than 6 in. (152 mm) with the dimensions taken in the most unfavorable location relative to the indications being evaluated.

WB-2546 Liquid Penetrant Examination

WB-2546.1 Examination Procedure.

The procedure for liquid penetrant examination shall be in accordance with the methods of Section V, Article 6.

WB-2546.2 Evaluation of Indications

(a) Mechanical discontinuities at the surface are revealed by bleeding out of the penetrant; however, localized surface discontinuities, such as may occur from machining marks, surface conditions, or an incomplete bond between base metal and cladding, may produce similar indications which are not relevant.

(b) Any indication in excess of the WB-2546.3 acceptance standards, which is believed to be nonrelevant, shall be reexamined to verify whether or not actual defects are present. Surface conditioning may precede the reexamination. Nonrelevant indications and broad areas of pigmentation, which would mask defects, are unacceptable.

(c) *Relevant indications* are indications which result from imperfections. *Linear indications* are indications in which the length is more than three times the width. *Rounded indications* are indications which are circular or elliptical with the length equal to or less than three times the width.

WB-2546.3 Acceptance Standards

(a) Only imperfections producing indications with major dimensions greater than $\frac{1}{16}$ in. (1.6 mm) shall be considered relevant imperfections.

(b) Imperfections producing the following indications are unacceptable:

(1) any linear indications greater than $\frac{1}{16}$ in. (1.6 mm) long for material less than $\frac{5}{8}$ in. (16 mm) thick, greater than $\frac{1}{8}$ in. (3.2 mm) long for material from $\frac{5}{8}$ in. (16 mm) thick to under 2 in. (51 mm) thick, and $\frac{3}{16}$ in. (4.8 mm) long for

material 2 in. (51 mm) thick and greater;⁸

16

(2) rounded indications with dimensions greater than $\frac{1}{8}$ in. (3.2 mm) for thicknesses less than $\frac{5}{8}$ in. (16 mm) and greater than $\frac{3}{16}$ in. (4.8 mm) for thicknesses $\frac{5}{8}$ in. (16 mm) and greater;

(3) four or more indications in a line separated by $\frac{1}{16}$ in. (1.6 mm) or less edge to edge;

(4) ten or more indications in any 6 sq in. (3,871 mm²) of area whose major dimension is no more than 6 in. (152 mm) with the dimensions taken in the most unfavorable location relative to the indications being evaluated.

Page 90

WB-2547 Time of Examination

Acceptance examinations, including those for repair welds, shall be performed at the time of manufacture as required in (a) through (e) below.

(a) Ultrasonic examination may be performed at any time after forging [WB-2541(d)], and the maximum practical volume, including weld repairs, if required, shall be examined after final heat treatment, excluding postweld heat treatment.

(b) Radiographic examination of repair welds, if required, may be performed prior to any required postweld heat treatment.

(c) Magnetic particle or liquid penetrant examination shall be performed in the finished condition, except repair welds of P-No. 1 material, 2 in. (51 mm) nominal thickness and less, may be examined prior to postweld heat treatment.

(d) Forgings and rolled bars which are to be bored or turned to form tubular parts or fittings shall be examined after boring or turning, except for threading.

(e) Forgings and forged or rolled bars which will subsequently be bored or turned to form valve parts shall be examined after boring or turning, except for threading.

WB-2548 Elimination of Surface Defects

Elimination of surface defects shall be made in accordance with WB-2538.

WB-2549 Repair by Welding

Repair by welding shall be in accordance with WB-2539, except that:

(a) the depth of repair that is permitted is not limited; and

(b) for ferritic steel forgings, the completed repair may be examined by the ultrasonic method in accordance with the requirements of WB-2542 in lieu of radiography.

WB-2550 EXAMINATION AND REPAIR OF SEAMLESS AND WELDED TUBULAR PRODUCTS AND FITTINGS

WB-2551 Required Examination

In addition to the requirements of the material specification and of this Article, seamless and welded tubular products (including pipe flanges and fittings machined from forgings and bars) shall comply with the following.

(a) Wrought seamless and welded pipe and tubing shall be examined over the entire volume⁵ of the material in accordance with (1), (2), (3), or (4), as follows. Tubular products may require both outside and inside surface conditioning prior to examination.

(1) Pipe and Tubing

(a) Pipe and tubing smaller than $2\frac{1}{2}$ in. (64 mm) O.D. shall be examined by the ultrasonic method in accordance with WB-2552.1(a) in two opposite circumferential directions⁶ and by the eddy current method in accordance with WB-2554

, provided the product is limited to sizes, materials, and thicknesses for which meaningful results can be obtained by eddy current examination as evidenced by detection of required standards. Each method shall be calibrated to the appropriate standard: that is, the ultrasonic method shall be calibrated to the axial notches or grooves of WB-2552.1(b), and the eddy current method shall be calibrated to the circumferential notches and grooves as well as the radial hole of WB-2554.2.

(b) As an alternative to the eddy current examination or when the eddy current examination does not yield meaningful results, an axial scan ultrasonic examination in two opposite axial directions,⁶ in accordance with WB-2552.1(b), shall be made.

(2) Pipe and tubing $2\frac{1}{2}$ in. (64 mm) O.D. and larger shall be examined by the ultrasonic method in accordance with WB-2552.1(a) in two opposite circumferential directions, and in accordance with WB-2552.1(b) in two opposite axial directions. Alternatively, for welded without filler metal pipe larger than $6\frac{3}{4}$ in. (70 mm) O.D., the plate shall be examined by the ultrasonic method in accordance with WB-2530 prior to forming and the weld shall be examined by the radiographic method in accordance with WB-2553. Radiographic examination of welds, including repair welds, shall be performed after final rolling and forming and may be performed prior to any required postweld heat treatment.

(3) Copper-nickel alloy and nickel alloy seamless pipe and tubing shall be examined as follows.

(a) Each pipe and tube, all sizes shall be ultrasonically examined in accordance with WB-2552.2(a) in two opposite circumferential directions.

⁵ The volumetric examinations required by this paragraph need only be conducted from one surface.

⁶ The direction of ultrasonic examinations referenced is the direction of sound propagation.

(b) Pipe and tubing smaller than $2\frac{1}{2}$ in. (64 mm) O.D. shall be examined by the eddy current method in accordance with WB-2554 if meaningful indications can be obtained from the reference specimen

Page 91

notches. If meaningful indications cannot be obtained from the reference specimen, an axial scan ultrasonic examination in two opposite axial directions, in accordance with WB-2552.1(b), shall be made.

(c) Pipe and tubing $2\frac{1}{2}$ in. (64 mm) O.D. and larger shall be examined by an axial scan ultrasonic examination in two opposite axial directions in accordance with WB-2552.1(b).

(d) Wrought seamless and welded without filler metal fittings (including pipe flanges and fittings machined from forgings and bars) shall be examined in accordance with the material specification, and in addition by the magnetic particle method in accordance with WB-2555, or the liquid penetrant method in accordance with WB-2556 on all external surfaces and all accessible internal surfaces (excluding bolt holes and threads). Additionally, for fittings over NPS 6 (DN 150), the entire volume shall be examined by the ultrasonic method, if feasible, in accordance with WB-2552, or the radiographic method in accordance with WB-2553. Alternatively, the plate shall be examined by the ultrasonic method in accordance with WB-2530 prior to forming and the weld shall be examined by the radiographic method in accordance with WB-2553. Radiographic examination of welds, including repair welds, shall be performed after final rolling and forming, and may be performed prior to any required postweld heat treatment.

WB-2552 Ultrasonic Examination⁶

WB-2552.1 Examination Procedure for Pipe and Tubing.

Independent channels or instruments shall be employed for circumferential and axial scans.

(a) *Circumferential Direction.* The procedure for ultrasonic examination of pipe and tubing in the circumferential direction shall be in accordance with SE-213 except as required in WB-2551(a)(1), (a)(2), and (a)(3)(a), and the requirements of this paragraph. The procedure shall provide a sensitivity which will consistently detect defects that produce indications equal to, or greater than, the indications produced by the standard defects included in the reference specimens specified in WB-2552.3.

(b) *Axial Direction.* When required by WB-2551, the ultrasonic examination of pipe and tubing shall include angle beam scanning in the axial direction. The procedure for the axial scans shall be in accordance with SE-213, except that

beam scanning in the axial direction. The procedure for the axial scans shall be in accordance with SE-213, except that the propagation of sound in the tube or pipe wall shall be in the axial direction instead of the circumferential direction and as required in WB-2551(a)(1)(b), (a)(2), and (a)(3)(b) and (c). Fig. WB-2552-1 illustrates the characteristic oblique entry of sound into the pipe or tube wall and the axial direction of ultrasonic energy propagation to detect transverse notches or similar surface discontinuities.

**FIG. WB-2552-1 AXIAL PROPAGATION
OF SOUND IN TUBE WALL**

FIG. WB-2552-1 AXIAL PROPAGATION OF SOUND IN TUBE WALL

(c) *Acceptance Standards.* Products with defects that produce indications in excess of the indications produced by the standard defects in the reference specimen are unacceptable unless the defects are eliminated or repaired in accordance with WB-2558 or WB-2559.

WB-2552.2 Examination Procedure for Fittings

(a) *Procedure.* The procedure for ultrasonic examination of fittings shall be in accordance with the requirements of SA-388 for straight beam examination and, where feasible, angle-beam examination in two circumferential directions.

(b) *Acceptance Standards.* Fittings shall be unacceptable if straight beam examination shows one or more reflectors which produce indications accompanied by complete loss of back reflection not associated with or attributable to the geometric configuration, or if angle beam examination results show one or more reflectors which produce indications exceeding in amplitude the indications from the calibrated notch. Complete loss of back reflection is assumed when the

back reflection falls below 5% of full calibration screen height.

WB-2552.3 Reference Specimens

(a) The reference specimen shall be of the same nominal diameter and thickness, and of the same nominal composition and heat treated condition as the product which is being examined. For circumferential scanning, the standard defects shall be axial notches or grooves on the outside and inside surfaces of the reference specimen, and shall have a length of approximately 1 in. (25 mm) or less, a width not to exceed $\frac{1}{16}$ in. (1.6 mm) for a square notch or U-notch, a width proportional

Page 92

to the depth for a V-notch, and a depth not greater than the larger of 0.004 in. (0.10 mm) or 5% of the nominal wall thickness. For axial scanning in accordance with SE-213, a transverse (circumferential) notch shall be introduced on the inner and outer surfaces of the standard. Dimensions of the transverse notch shall not exceed those of the longitudinal notch. The reference specimen may be the product being examined.

(b) The reference specimen shall be long enough to simulate the handling of the product being examined through the examination equipment. When more than one standard defect is placed in a reference specimen, the defects shall be located so that indications from each defect are separate and distinct without mutual interference or amplification. All upset metal and burrs adjacent to the reference notches shall be removed.

WB-2552.4 Checking and Calibration of Equipment.

The proper functioning of the examination equipment shall be checked and the equipment shall be calibrated by the use of the reference specimens, as a minimum:

(a) at the beginning of each production run of a given size and thickness of a given material;

(b) after each 4 hr or less during the production run;

(c) at the end of the production run;

(d) at any time that malfunctioning is suspected. If, during any check, it is determined that the test equipment is not functioning properly, all of the product that has been tested since the last valid equipment calibration shall be reexamined.

WB-2553 Radiographic Examination

(a) *General.* When radiographic examination is performed as an alternative for ultrasonic examination of the entire volume of the material, it shall apply to the entire volume of the pipe, tube, or fitting material. Acceptance standards specified for welds shall apply to the entire volume of material examined.

(b) *Examination Procedure.* The radiographic examination shall be performed in accordance with Article 2 of Section V, as modified by WB-5111.

(c) *Acceptance Standard.* Welds that are shown by radiography to have any of the following types of discontinuities are unacceptable:

(1) any type of crack or zone of incomplete fusion or penetration;

(2) any other elongated indication which has a length greater than:

(a) $\frac{1}{4}$ in. for t up to $\frac{3}{4}$ in., inclusive

(b) $\frac{1}{3}t$ for t from $\frac{3}{4}$ in. to $2\frac{1}{4}$ in., inclusive

(c) $\frac{3}{4}$ in. for t over $2\frac{1}{4}$ in.

where t is the thickness of the thinner portion of the weld;

(3) any group of aligned indications having an aggregate length greater than t in a length of $12t$, unless the minimum distance between successive indications exceeds $6L$, in which case the aggregate length is unlimited, L being the length

of the largest indication;

(4) rounded indications in excess of that shown as acceptable in Appendix VI.

WB-2554 Eddy Current Examination

This examination method is restricted to materials with uniform magnetic properties and of sizes for which meaningful results can be obtained.

WB-2554.1 Examination Procedure.

The procedure for eddy current examination shall provide a sensitivity that will consistently detect defects by comparison with the standard defects included in the reference specimen specified in WB-2554.2. Products with defects that produce indications in excess of the reference standards are unacceptable unless the defects are eliminated or repaired in accordance with WB-2558 or WB-2559 as applicable.

WB-2554.2 Reference Specimens.

The reference specimen shall be of the same nominal diameter and thickness, and of the same nominal composition and heat treated condition as the product that is being examined. The standard shall contain tangential or circumferential notches on the outside surface plus a $\frac{1}{16}$ in. (1.6 mm) diameter hole drilled through the wall. For copper-nickel alloy and nickel alloy materials, the standard shall have one notch extending circumferentially on the outside surface and one notch extending circumferentially on the inside surface plus a $\frac{1}{16}$ in. (1.6 mm) diameter hole drilled through the wall. These shall be used to establish the rejection level for the product to be tested. The reference notches shall have a depth not greater than the larger of 0.004 in. (0.10 mm) or 5% of the wall thickness. The width of the notch shall not exceed $\frac{1}{16}$ in. (1.6 mm). The length shall be approximately 1 in. (25 mm) or less. The size of reference specimens shall be as specified in WB-2552.3.

WB-2554.3 Checking and Calibration of Equipment.

The checking and calibration of examination equipment shall be the same as in WB-2552.4.

Page 93

WB-2555 Magnetic Particle Examination

Magnetic particle examination shall be performed in accordance with the requirements of WB-2545.

WB-2556 Liquid Penetrant Examination

Liquid penetrant examination shall be performed in accordance with the requirements of WB-2546.

WB-2557 Time of Examination

(a) Products that are quenched and tempered shall be examined, as required, after the quenching and tempering heat treatment.

(b) Products that are not quenched and tempered shall receive the required examinations as follows.

(1) Ultrasonic or eddy current examination, when required, shall be performed after final heat treatment, except postweld heat treatment.

(2) Radiographic examination, when required, may be performed prior to any required postweld heat treatment.

(3) Magnetic particle or liquid penetrant examination, including repair welds, shall be performed after final heat treatment, except that the examination may be performed prior to postweld heat treatment for P-No. 1 (Section IX of the Code) materials of 2 in. (51 mm) and less nominal thickness.

(4) Forgings and rolled bars which are to be bored and/or turned to form tubular parts or fittings shall be examined after boring and/or turning, except for threading. Fittings shall be examined after final forming.

WB-2558 Elimination of Surface Defects

Surface defects shall be removed by grinding or machining, provided the requirements of (a) through (c) below are met.

(a) The depression, after defect elimination, is blended uniformly into the surrounding surface.

(b) After defect elimination, the area is examined by the method which originally disclosed the defect to assure that the defect has been removed or reduced to an imperfection of acceptable size.

(c) If the elimination of the defect reduces the thickness of the section below the minimum required to satisfy the rules of WB-3000, the product shall be repaired in accordance with WB-2559.

WB-2559 Repair by Welding

Repair of defects shall be in accordance with WB-2539, except repair by welding is not permitted on copper-nickel alloy and nickel alloy materials.

WB-2570 EXAMINATION AND REPAIR OF STATICALLY AND CENTRIFUGALLY CAST PRODUCTS

In addition to the requirements of the material specification and of this Article, statically and centrifugally cast products shall comply with the following subparagraphs.

WB-2571 Required Examination

Cast products shall be examined by the radiographic method, except cast ferritic steels which shall be examined by either the radiographic or ultrasonic method, or a combination of both methods, as required for the product form by Table WB-2571-1.

In addition, all cast products shall be examined on all external surfaces and all accessible internal surfaces by either the magnetic particle or liquid penetrant method. Machined surfaces, except threaded surfaces, of a cast product shall be examined by either the liquid penetrant or magnetic particle method after machining.

WB-2572 Time of Nondestructive Examination

(a) *Ultrasonic Examination.* Ultrasonic examination, if required, shall be performed at the same stage of manufacture as required for radiography.

(b) *Radiographic Examination.* Radiography may be performed prior to or after finish machining at the following limiting thicknesses.

(1) For finished thicknesses under $2\frac{1}{2}$ in. (64 mm), castings shall be radiographed within 20% of the finished thickness when Type 2 radiographic film is used or within $\frac{1}{2}$ in. (13 mm) of the finished thickness when Type 1 radiographic film is used. The penetrameter and the acceptance reference radiographs shall be based on the finished thickness.

(2) For finished thickness from $2\frac{1}{2}$ in. (64 mm) up to 6 in. (152 mm), castings shall be radiographed within 20% of the finished thickness. The penetrameter and the acceptance reference radiographs shall be based on the finished thickness.

(3) For finished thicknesses over 6 in. (152 mm), castings shall be radiographed with $\frac{1}{2}$ in. (13 mm) or 15% of the finished thickness, whichever is greater.

The penetrameter and the acceptance reference radiographs shall be based on the finished thickness.

TABLE WB-2571-1 REQUIRED EXAMINATIONS

Nominal Pipe Size	Item	Applicable Special Requirements for Class 1 Castings
Inlet piping connections of 2 in. and less	Cast products other than valves	Cast products shall be examined by the radiographic method, except cast ferritic steels, which shall be examined by either the radiographic or ultrasonic method, or a combination of both methods. Castings or sections of castings which have coarse grains or configurations which do not yield meaningful examination results by the ultrasonic method shall be examined by the radiographic method. In addition, all cast products shall be examined on all external surfaces and all accessible internal surfaces by either the magnetic particle or the liquid penetrant method. Machined surfaces, except threaded surfaces, of a cast product shall be examined by either the liquid penetrant or the magnetic particle method after machining.
	Cast valves	None
	Repair welds in valves of P-No. 1 or P-No. 8 material	None
	Repair welds in cast products, excluding repair welds in valves of P-No. 1 or P-No. 8 material	Each repair weld shall be examined by the magnetic particle method or by the liquid penetrant method. In addition, repair welds in cavities the depth of which exceed the lesser of $\frac{3}{8}$ in. or 10% of the section thickness shall be radiographed in accordance with WB-2575.
Inlet piping connections over 2 in. up to and including 4 in.	Cast products — See <i>Cast valves</i> below for exceptions	Cast products shall be examined by the radiographic method, except cast ferritic steels, which shall be examined by either the radiographic or the ultrasonic method, or a combination of both methods. Castings or sections of castings which have coarse grains or configurations which do not yield meaningful examination results by the ultrasonic method shall be examined by the radiographic method. In addition, all cast products shall be examined on all external surfaces and all accessible internal surfaces by either the magnetic particle or the liquid penetrant method. Machined surfaces, except threaded surfaces, of a cast product shall be examined by either the liquid penetrant or the magnetic particle method after machining.
	Cast valves	Magnetic particle or liquid penetrant examination may be performed, in lieu of volumetric examination, except the welding ends of cast valves shall be radiographed for a minimum distance of t (when t is the design section thickness of the weld) from the final weld end.
	Repair welds	Each repair weld shall be examined by the magnetic particle method or by the liquid penetrant method. In addition, repair welds in cavities the depth of which exceed the lesser of $\frac{3}{8}$ in. or 10% of the section thickness shall be radiographed in accordance with WB-2575.
Inlet piping connections over 4 in.	Cast products	Cast products shall be examined by the radiographic method, except cast ferritic steels, which shall be examined by either the radiographic or the ultrasonic method, or a combination of both methods. Castings or sections of castings which have coarse grains or configurations which do not yield meaningful examination results by the ultrasonic method shall be examined by the radiographic method. In addition, all cast products shall be examined on all external surfaces and all accessible internal surfaces by either the magnetic particle or the liquid penetrant method. Machined surfaces, except threaded surfaces, of a cast product shall be examined by either the liquid penetrant or the magnetic particle method after machining.
	Repair welds	Each repair weld shall be examined by the magnetic particle method or by the liquid penetrant method. In addition, repair welds in cavities the depth of which exceed the lesser of $\frac{3}{8}$ in. or 10% of the section thickness shall be radiographed in accordance with WB-2575.

TABLE WB-2571-1 REQUIRED EXAMINATIONS

(c) Radiography of castings for valves may be performed in as-cast or rough machined thickness exceeding the limits of (b)(1), (b)(2), or (b)(3) above, subject to the following conditions.

(1) When the thickness of the as-cast or rough machined section exceeds 2 in. (51 mm), acceptance shall be based on reference radiographs for the next lesser thickness; e.g., if the section being radiographed exceeds $4\frac{1}{2}$ in. (114 mm), use reference radiographs of ASTM E 186-75 (reapproved 1979). The penetrameter shall be based on the thickness of the section being radiographed.

(2) When the thickness of the as-cast or rough machined section is 2 in. (51 mm) or less, the reference radiographs of ASTM E 446-78 shall be used and the penetrameter shall be based on the final section thickness.

(3) Weld ends for a minimum distance of t or $\frac{1}{2}$ in. (13 mm), whichever is less (where t is the design section thickness of the weld), from the final welding end shall be radiographed at a thickness within the limits given in (b)(1), (b)(2), or (b)(3) above as applicable. As an alternative, the weld ends may be radiographed in the as-cast or rough machined thickness in accordance with (c)(1) and (c)(2) above, and the penetrameter shall be based on the final section thickness.

(d) *Magnetic Particle or Liquid Penetrant Examination.* Magnetic particle or liquid penetrant examination shall be performed after the final heat treatment required by the material specification. Repair weld areas shall be examined after postweld heat treatment when a postweld heat treatment is performed, except that repair welds in P-No. 1 (see Section IX of the Code) material 2 in. (51 mm) nominal thickness and less may be examined prior to postweld heat treatment. For cast products with machined surfaces, all finished machined surfaces, except threaded surfaces and small deep holes, shall also be examined by the magnetic particle or the liquid penetrant method.

WB-2573 Provisions for Repair of Base Material by Welding

The Material Organization may repair, by welding, products from which defects have been removed, provided the requirements of this Article are met.

WB-2573.1 Defect Removal.

The defects shall be removed or reduced to an acceptable size by suitable mechanical or thermal cutting or gouging methods, and the cavity prepared for repair. When thermal cutting is performed, consideration shall be given to preheating the material.

WB-2573.2 Repair by Welding.

The Material Organization may repair castings by welding after removing the material containing unacceptable defects. The depth of the repair is not limited. A cored hole or access hole may be closed by the Material Organization by welding in accordance with the requirements of this paragraph, provided the hole is closed by filler metal only. If the hole is closed by welding in a metal insert, the welding shall be performed by a holder of a Certificate of Authorization in accordance with the requirements of the Code.

WB-2573.3 Qualification of Welding Procedures and Welders.

Each manufacturer is responsible for the welding done by his organization and shall establish the procedures and conduct the tests required by WB-4000 and by Section IX of the Code in order to qualify both the welding procedures and the performance of welders and welding operators who apply these procedures. He is also responsible for the welding performed by his subcontractors and shall assure himself that the subcontractors conduct the tests required by WB-4000 and by Section IX of the Code in order to qualify their welding procedures and the performance of their welders and welding operations.

WB-2573.4 Blending of Repaired Areas.

After repair, the surface shall be blended uniformly into the surrounding surface.

WB-2573.5 Examination of Repair Welds

(a) Each repair weld shall be examined by the magnetic particle method in accordance with the requirements of

WB-2577 or by the liquid penetrant method in accordance with the requirements of WB-2576. In addition, when radiography is specified in the order for the original casting, repair cavities, the depth of which exceeds the lesser of $\frac{3}{8}$ in. (10 mm) or 10% of the nominal wall thickness, shall be radiographed after repair except that weld slag, including elongated slag, shall be considered as inclusions under Category B of the applicable reference radiographs. The total area of all inclusions, including slag inclusions, shall not exceed the limits of the applicable severity level of Category B of the reference radiographs. The penetrameter and the acceptance standards for radiographic examination of repair welds shall be based on the actual section thickness at the repair area.

(b) Examination of repair welds in P-No. 1 and P-No. 8 material is not required for valves with inlet piping connections NPS 2 (DN 50) and less.

Page 96

WB-2573.6 Heat Treatment After Repairs.

The material shall be heat treated after repair in accordance with the heat treatment requirements of WB-4620, except that the heating and cooling rate limitations of WB-4623 do not apply.

WB-2573.7 Elimination of Surface Defects.

Surface defects shall be removed by grinding or machining provided the requirements of (a) through (c) below are met.

(a) The depression, after defect elimination, is blended uniformly into the surrounding surface.

(b) After defect elimination, the area is reexamined by the magnetic particle method in accordance with WB-2577 or the liquid penetrant method in accordance with WB-2576 to assure that the defect has been removed or reduced to an imperfection of acceptable size.

(c) If the elimination of the defect reduces the section thickness below the minimum required by the specification or drawing, the casting shall be repaired in accordance with WB-2539.

WB-2573.8 Material Report Describing Defects and Repairs.

Each defect repair exceeding in depth the lesser of $\frac{3}{4}$ in. (19 mm) or 10% of the nominal wall thickness shall be described in the Certified Material Test Report. The Certified Material Test Report for each piece shall include a chart that shows the location and size of the prepared cavity, the welding material identification, the welding procedure, the heat treatment, and the examination results, including radiographic film, when radiography is specified in the order for the original casting.

WB-2574 Ultrasonic Examination of Ferritic Steel Castings

Ultrasonic examination shall be performed in accordance with T-541.4 of Article 5 of Section V. Each manufacturer shall certify that the procedure is in accordance with the requirements of WB-2574 and shall make the procedure available for approval upon request.

WB-2574.1 Acceptance Standards

(a) The Quality Levels of SA-609 as shown in Section V shall apply for the casting thicknesses indicated:

(1) Quality Level 1 for thicknesses up to 2 in. (51 mm);

(2) Quality Level 3 for thicknesses 2 in. (51 mm) to 4 in. (102 mm);

(3) Quality Level 4 for thicknesses greater than 4 in. (102 mm).

(b) In addition to the Quality Level requirements stated in (a) above, the requirements in (1) through (5) below shall apply for both straight beam and angle beam examination.

(1) Areas giving indications exceeding the Amplitude Reference Line with any dimension longer than those specified in the following tabulation are unacceptable:

UT Quality Level	Longest Dimension of Area ⁷⁸⁹
1	1.5 in.
2	2.0 in.
3	2.5 in.
4	3.0 in.

(2) Quality Level 1 shall apply for the volume of castings within 1 in. (25 mm) of the surface regardless of the overall thickness.

(3) Discontinuities indicated to have a change in depth equal to or greater than one-half the wall thickness or 1 in. (25 mm) (whichever is less) are unacceptable.

(4) Two or more indications in the same plane with amplitudes exceeding the Amplitude Reference Line and separated by a distance less than the longest dimension of the larger of the adjacent indications are unacceptable if they cannot be encompassed within an area less than that of the Quality Level specified in (b)(1) above.

(5) Two or more indications greater than permitted for Quality Level 1 for castings less than 2 in. (51 mm) in thickness, greater than permitted for Quality Level 2 for thicknesses 2 in. (51 mm) through 4 in. (102 mm), and greater than permitted for Level 3 for thicknesses greater than 4 in. (102 mm), separated by a distance less than the longest dimension of the larger of the adjacent indications are unacceptable, if they cannot be encompassed in an area less than that of the Quality Level requirements stated in (a) above.

7 The areas for the Ultrasonic Quality Levels in SA-609 refer to the surface area on the casting over which continuous indication, exceeding the transfer corrected distance amplitude curve, is maintained.

8 Areas are to be measured from dimensions of the movement of the search unit, using the center of the search unit as the reference point.

9 In certain castings, because of very long metal path distances or curvature of the examination surfaces, the surface area over which a given discontinuity is detected may be considerably larger or smaller than the actual area of the discontinuity in the casting; in such cases, other criteria which incorporate a consideration of beam angles or beam spread must be used for realistic evaluation of the discontinuity.

WB-2575 Radiographic Examination

WB-2575.1 Examination.

Cast containment system materials shall be examined by the radiographic method when specified in the order for the original castings, except that cast ferritic steels may be examined by either the radiographic or ultrasonic method, or a combination of both methods. Castings or sections of castings that have coarse grains or configurations that do not yield meaningful examination results by ultrasonic methods shall be examined by the radiographic method.

WB-2575.2 Extent.

Radiographic examination shall be performed on containment system castings such as vessel heads and flanges, valve bodies, bonnets and disks, pump casings and covers, and piping and fittings. The extent of radiographic coverage shall be of the maximum feasible volume and, when the shape of the casting precludes complete coverage, the coverage shall be at least as exemplified in the typical sketches as shown in Fig. WB-2575.2-1.

WB-2575.3 Examination Procedure.

The radiographic examination shall be performed in accordance with Article 3 of Section V, with the following modifications.

(a) *Film Selection.* Only Types 1, 2, and 3 are permitted.

(b) *Radiographic Density.* The transmitted film density through the radiographic image of the body of the appropriate penetrometer and the area of interest shall be 1.3 minimum for single film viewing. For composite viewing of multiple film exposures, each film of the composite set shall have a minimum density of 1.0. The maximum density shall be 4.0

for either single or composite viewing. A tolerance of 0.05 in density is allowed for variations between densitometer readings.

(c) The requirements of T-274 and T-285 of Article 3 of Section V need not be met.

(d) *Image Quality Indicator (IQI) Design.* Penetrators shall be manufactured and identified in accordance with the requirements or alternates allowed in SE-142 and Appendices.

(e) *Image Quality Indicator (IQI) Selection.* The radiographic quality level shall be 2-4 *T* for section thicknesses up to and including $\frac{3}{4}$ in. (19 mm) and 2-2 *T* for section thicknesses greater than $\frac{3}{4}$ in. (19 mm) Radiographic quality is defined in Note 2 of SE-94.

(f) When radiographing weld ends of cast valves, NPS 4 (DN 100) and less, double-wall radiography may be used subject to the conditions of (1) and (2) below.

(1) The penetrometer thickness shall be based on the design section thickness of the double wall, excluding the weld preparation lip.

(2) Acceptance standards shall be based on nominal single-wall thickness.

WB-2575.4 Procedure Requirements.

Radiographic examination shall be performed in accordance with a written procedure. Each manufacturer shall certify that the procedure is in accordance with the requirements of WB-2575. The procedure shall be available for the interpretation of the films and shall be submitted together with the radiographs. Each procedure shall include at least the following information:

(a) the type of material to be radiographed;

(b) the material thickness ranges to be radiographed;

(c) the type of radiation source, actual or maximum source size or focal spot, X-ray equipment voltage rating and manufacturer. The equipment manufacturer's or supplier's publications, such as technical manuals, decay curves, or written statements documenting the actual or maximum source size or focal spot, shall be acceptable as source size verification. For X-ray machines 320 kV and less, the focal spot size may be determined by the pinhole method;¹⁰

(d) type and thickness of intensifying screens and filters;

(e) minimum source-to-film distance.

WB-2575.5 Radiographic Setup Information.

To aid in proper interpretation of radiographs, details of the radiographic examination setup used shall accompany each group of radiographs. As a minimum, the information shall include:

(a) film brand and the type and number of films in the cassette;

(b) for multiple film technique, state whether viewing is to be single or superimposed;

(c) blocking or masking technique, if used;

(d) isotope or X-ray voltage used;

(e) source-to-film distance used;

(f) distance between film and object when film/cassette is not in contact with object;

(g) geometric arrangement for the radiograph(s) (sketch);

(h) orientation of location markers;

(i) description of how internal markers, when used, locate area of interest;

10 Nondestructive Testing Handbook, Volume I, First Edition, pp. 14.32, 14.33, "Measuring Focal-Spot Size." Also, pp. 20, 21 of Radiography in Modern Industry, Fourth Edition.

shall be permanently stamped on the surface of the casting being radiographed in a manner permitting the area of interest on a radiograph to be accurately located on the casting and providing evidence on the radiograph that the extent of coverage required by WB-2575.2 has been obtained. On castings or sections of castings where stamping is not feasible, the radiographic procedure shall so state, in which case a radiographic film location map shall be provided.

FIG. WB-2575.2-1 TYPICAL PARTS OF VALVES FOR RADIOGRAPHIC EXAMINATION

FIG. WB-2575.2-1 TYPICAL PARTS OF VALVES FOR RADIOGRAPHIC EXAMINATION

WB-2575.6 Acceptance Criteria.

Castings shall meet the acceptance requirements of Severity Level 2 of ASTM E 446-72, E 446-75, or E 446-78, Reference Radiographs for Steel Castings up to 2 in. in Thickness, ASTM E 186-67, E 186-73, or E 186-75, Reference Radiographs for Heavy-Walled (2 to 4 $\frac{1}{2}$ in.) Steel Castings, as graphed, except that Category D, E, F, or G defects are not acceptable. The requirements of ASTM E 280-68, E 280-72, or E 280-75 shall apply for castings 4 $\frac{1}{4}$ to 12 in. (108 mm to 305 mm) in thickness.

WB-2576 Liquid Penetrant Examination

(a) Castings shall be examined, if required, on all accessible surfaces by the liquid penetrant method in accordance with Section V of the Code.

(b) *Evaluation of Indications.* All indications shall be evaluated in terms of the acceptance standards. Mechanical discontinuities intersecting the surface are indicated by bleeding out of the penetrant; however, localized surface discontinuities as may occur from machining marks, scale, or dents, may produce indications which are not relevant. Any indication in excess of the acceptance standards believed to be nonrelevant shall be regarded as a defect until it is reexamined to verify whether actual defects are present. Nonrelevant indications and broad areas of pigmentation that would mask indications of defects are unacceptable. Surface conditioning may precede the reexamination. Relevant indications are those which result from mechanical discontinuities. Linear indications are those whose length is more than three times the width. Rounded indications are those which are circular or elliptical with the length less than three times the width. Indications with major dimensions greater than $\frac{1}{16}$ in. (1.6 mm) are considered relevant.

(c) *Acceptance Standards.* The following relevant indications are unacceptable:

(1) any linear indications greater than $\frac{1}{16}$ in. (1.6 mm) long for materials less than $\frac{5}{8}$ in. (16 mm) thick, greater than $\frac{1}{8}$ in. (3.2 mm) long for materials from $\frac{5}{8}$ in. (16 mm) thick to under 2 in. (51 mm) thick, and $\frac{3}{16}$ in. (4.8 mm) long for materials 2 in. (51 mm) thick and greater;

(2) rounded indications with dimensions greater than $\frac{1}{8}$ (3.2 mm) in. for thicknesses less than $\frac{5}{8}$ in. (16 mm) and greater than $\frac{3}{16}$ in. (4.8 mm) for thicknesses $\frac{5}{8}$ in. (16 mm) and greater;

(3) four or more relevant indications in a line separated by $\frac{1}{16}$ in. (1.6 mm) or less edge to edge;

(4) ten or more relevant indications in any 6 sq in. (3,871 mm²) of surface with the major dimension of this area not to exceed 6 in. (152 mm) taken in the most unfavorable orientation relative to the indications being evaluated.

WB-2577 Magnetic Particle Examination (for Ferritic Steel Products Only)

(a) Castings of magnetic material shall be examined, if required, on all accessible surfaces by a magnetic particle method in accordance with Section V of the Code.

(b) *Evaluation of Indications.* All indications shall be evaluated in terms of the acceptance standards. Mechanical discontinuities intersecting the surface are indicated by retention of the examination medium. All indications are not necessarily defects since certain metallurgical discontinuities and magnetic permeability variations may produce indications that are not relevant. Any indication in excess of the acceptance standards which is believed to be nonrelevant shall be regarded as a defect until it is reexamined to verify whether actual defects are present. Nonrelevant indications which would mask indications of defects are unacceptable. Surface conditioning may precede the reexamination. Relevant indications are those which result from unacceptable mechanical discontinuities and have a major dimension greater than $\frac{1}{16}$ in. (1.6 mm). Linear indications are those whose length is more than three times the width. Rounded indications are those which are circular or elliptical with the length less than three times the width.

(c) *Acceptance Standards.* The following relevant indications are unacceptable:

(1) linear indications greater than $\frac{1}{16}$ in. (1.6 mm) long for materials less than $\frac{5}{8}$ in. (16 mm) thick, greater than $\frac{1}{8}$ in. (3.2 mm) long for materials from $\frac{5}{8}$ in. (16 mm) thick to under 2 in. (51 mm) thick, and $\frac{3}{16}$ in. (4.8 mm) long for materials 2 in. (51 mm) thick and greater;

(2) rounded indications with dimensions greater than $\frac{1}{8}$ in. (3.2 mm) long for materials from $\frac{5}{8}$ in. (16 mm) thick to under 2 in. (51 mm) thick, and $\frac{3}{16}$

Page 100

in. (4.8 mm) long for materials 2 in. (51 mm) thick and greater.

(3) four or more relevant indications in a line separated by $\frac{1}{16}$ in. (1.6 mm) or less edge to edge;

(4) ten or more relevant indications in any 6 sq in. (3,871 mm²) of surface with the major dimension of this area not to exceed 6 in. (152 mm) taken in the most unfavorable orientation relative to the indications being evaluated.

WB-2580 EXAMINATION OF BOLTS, STUDS, AND NUTS

WB-2581 Required Examination

All bolting material shall be visually examined in accordance with WB-2582. Nominal sizes greater than 1 in. (25 mm) shall be examined by either the magnetic particle or the liquid penetrant method. In addition, nominal sizes greater than 2 in. (51 mm) but not over 4 in. (102 mm) shall be examined by the ultrasonic method as required by WB-2585 and nominal sizes greater than 4 in. (102 mm) shall be examined by the ultrasonic method as required by WB-2586.

WB-2582 Visual Examination

The areas of threads, shanks, and heads of final machined parts shall be visually examined. Harmful discontinuities such as laps, seams, or cracks that would be detrimental to the intended service are unacceptable.

WB-2583 Magnetic Particle Examination (for Ferritic Steel Bolting Material Only)

WB-2583.1 Examination Procedure.

All bolts, studs, and nuts greater than 1 in. (25 mm) nominal bolt size shall be examined by the magnetic particle method in accordance with ASTM A 275-78. If desired, the supplier may perform liquid penetrant examination in accordance with WB-2584 instead of magnetic particle examination. Such examination shall be performed on the finished component after threading or on the materials stock at approximately the finished diameter before threading and after heading (if involved). This examination shall be performed on all accessible surfaces.

WB-2583.2 Evaluation of Indications

(a) All indications shall be evaluated in terms of the acceptance standards. Linear indications are those indications in which the length is more than three times the width. Rounded indications are those which are circular or elliptical with the length equal to or less than three times the width.

(b) All indications are not necessarily relevant: leakage of magnetic fields and permeability variations may produce indications that are not relevant to the detection of unacceptable discontinuities. Indications with major dimensions of $\frac{1}{16}$ in. (1.6 mm) or less are not relevant.

(c) Any indication that is believed to be nonrelevant, and that is larger than acceptable, shall be considered to be a defect and shall be reexamined after light surface conditioning.

(d) Any indication observed during such reexamination shall be considered relevant and shall be evaluated in terms of the acceptance standards.

(e) As an alternative to magnetic particle reexamination, other nondestructive examination means (such as liquid penetrant examination for surface discontinuities) may be used to determine relevancy.

WB-2583.3 Acceptance Standard.

Linear nonaxial indications are unacceptable. Linear axial indications greater than 1 in. (25 mm) in length are unacceptable.

WB-2584 Liquid Penetrant Examination

WB-2584.1 Examination Procedure.

All bolts, studs, and nuts greater than 1 in. (25 mm) nominal bolt size shall be examined by a liquid penetrant method in accordance with the methods of Article 6, Section V. Such examination shall be performed on the finished component after threading or on the materials stock at approximately the finished diameter before threading and after heading (if involved).

WB-2584.2 Evaluation of Indications.

All indications shall be evaluated in terms of the acceptance standards. Linear indications are those indications in which the length is more than three times the width. Rounded indications are those which are circular to elliptical with the length equal to or less than three times the width. All penetrant indications are not necessarily relevant. Surface imperfections such as machining marks and scratches may produce indications that are nonrelevant to the detection of unacceptable discontinuities. Broad areas of pigmentation, which could mask indications of defects, are unacceptable. Indications with major dimensions of $\frac{1}{16}$ in. (1.6 mm) or less are not relevant. Any indication that is believed to be nonrelevant, and that is larger than acceptable, shall be considered to be a defect and shall be reexamined after light surface conditioning. Any area of pigmentation also shall be reexamined after recleaning or light surface conditioning, as appropriate. Any indication observed during such reexamination shall be considered relevant

Page 101

and shall be evaluated in terms of the acceptance standards.

WB-2584.3 Acceptance Standard.

Linear nonaxial indications are unacceptable. Linear axial indications greater than 1 in. (25 mm) long are unacceptable.

WB-2585 Ultrasonic Examination for Sizes Greater Than 2 in. (51 mm)

All bolts, studs, and nuts greater than 2 in. (51 mm) nominal bolt size shall be ultrasonically examined over the entire surface prior to threading in accordance with the following requirements.

WB-2585.1 Ultrasonic Method.

Examination shall be carried out by the straight beam, radial-scan method in accordance with SA-388 of Article 23 of Section V.

WB-2585.2 Examination Procedure.

Examination shall be performed at a nominal frequency of 2.25 MHz with a search unit not to exceed 1 sq in. (645 mm²).

WB-2585.3 Calibration of Equipment.

Calibration sensitivity shall be established by adjustment of the instrument so that the first back reflection is 75% to 90% of full-screen height.

WB-2585.4 Acceptance Standard.

Any discontinuity that causes an indication in excess of 20% of the height of the first back reflection or any discontinuity that prevents the production of a first back reflection of 50% of the calibration amplitude is not acceptable.

WB-2586 Ultrasonic Examination for Sizes Over 4 in. (102 mm)

In addition to the requirements of WB-2585, all bolts, studs, and nuts over 4 in. (102 mm) nominal bolt size shall be ultrasonically examined over the entire end surface before or after threading in accordance with the following

requirements.

WB-2586.1 Ultrasonic Method.

Examination shall be carried out by the straight beam, longitudinal-scan method.

WB-2586.2 Examination Procedure.

Examination shall be performed at a nominal frequency of 2.25 MHz with a search unit having a circular cross section with a diameter not less than $\frac{1}{2}$ in. (13 mm) nor more than $1\frac{1}{8}$ in. (29 mm).

WB-2586.3 Calibration of Equipment.

Calibration shall be established on a test bar of the same nominal composition and diameter as the production part and a minimum of one-half of the length. A $\frac{3}{8}$ in. (10 mm) diameter by 3 in. (76 mm) deep flat-bottom hole shall be drilled in one end of the bar and plugged to full depth. A distance-amplitude curve shall be established by scanning from both ends of the test bar.

WB-2586.4 Acceptance Standard.

Any discontinuity that causes an indication in excess of that produced by the calibration hole in the reference specimen as corrected by the distance-amplitude curve is not acceptable.

WB-2587 Time of Examination

Acceptance examinations shall be performed after the final heat treatment required by the basic material specification.

WB-2588 Elimination of Surface Defects

Unacceptable surface defects on finished bolts, studs, and nuts are not permitted, and are cause for rejection.

WB-2589 Repair by Welding

Weld repairs of bolts, studs, and nuts are not permitted.

WB-2600 MATERIAL ORGANIZATION'S QUALITY SYSTEM PROGRAMS

WB-2610 DOCUMENTATION AND MAINTENANCE OF QUALITY SYSTEM PROGRAMS

(a) Except as provided in (b) below, Material Organizations shall have a Quality System Program or an Identification and Verification Program, as applicable, which meets the requirements of WA-3800.

(b) The requirements of WA-3862 and WA-3856 shall be met as required by WB-2130 and WB-2150, respectively. The other requirements of WA-3800 need not be used by Material Organizations for small products, as defined in (c) below, and for material which is allowed by this Subsection to be furnished with a Certificate of Compliance. For these products, the Certificate Holder's Quality Assurance Program (WA-4000) shall include measures to provide assurance that the material is furnished in accordance with the material specification and with the applicable requirements of this Subsection.

(c) For the purpose of this paragraph, small products are defined as given in (1) through (4) below:

- (1) pipe, tube, pipe fittings, and flanges NPS 2 (DN 50) and less;
- (2) bolting material, including studs, nuts, and bolts of 1 in. (25 mm) nominal diameter and less;
- (3) bars with a nominal cross-sectional area of 1 sq in. (645 mm²) and less; and
- (4) material for valves with inlet pipe connections of NPS 2 (DN 50) and less.

WB-2700 DIMENSIONAL STANDARDS

Dimensions of standard items shall comply with the standards and specifications listed in Table WB-3132-1.

July 1, 1998

American Society Of Mechanical Engineers

SEC III D3 WB-3000

ARTICLE WB-3000 DESIGN

Page 103

WB-3100 GENERAL DESIGN

WB-3110 LOADING CRITERIA

WB-3111 Loading Conditions

The loadings that shall be taken into account in designing a containment component include, but are not limited to, those in (a) through (g) below:

- (a) internal and external pressure;
- (b) impact loads;
- (c) weight of the component and normal contents under operating or test conditions, including additional pressure due to static and dynamic head of liquids;
- (d) superimposed loads such as other components, operating equipment, impact limiting devices, shielding, insulation, and corrosion resistant or erosion resistant linings;
- (e) transportation and handling shock and vibration loads;
- (f) reactions of attachment and supports;
- (g) temperature effects due to the contents, the external environment, and other components.

WB-3111.1 Maximum Normal Operating Pressure (MNOP).

Maximum Normal Operating Pressure is the maximum pressure that would develop in the containment system in a period of one year under normal conditions of transportation without venting.

WB-3111.2 Maximum Normal In-Plant Handling Pressure (MNIP).

Maximum Normal In-Plant Handling Pressure is the maximum pressure that would develop in the containment system under the most severe conditions of normal in-plant handling operations.

WB-3112 Operating Conditions

- (a) Containment systems of transport packaging (WA-1110) are subject to operating conditions, which are required to be considered in the design of the transport packaging in order to satisfy applicable safety criteria.
- (b) Operating conditions for transport packaging are classified as either normal operating conditions or hypothetical accident conditions. Normal operating conditions include normal conditions of transport and in-plant handling conditions.
- (c) As a consequence of specific operating conditions, containment systems are subject to pressure, temperature, and mechanical loadings.
- (d) The selection of operating conditions, and the determination of their significance to the design and operability of the

containment system, are beyond the scope of this Division. Appropriate guidance for the selection of operating conditions may be derived from safety criteria documents for transport packaging and the requirements of regulatory and enforcement authorities having jurisdiction.

WB-3113 Test Conditions

(a) Each containment system shall be subject to pressure test (WB-6000). The minimum test pressure shall not be less than either 1.5 times MNOP or 1.25 times MNIP.

(b) Other additional proof test may be specified by the Design Owner in the Design Specification.

WB-3114 Stress Limits

Stress limits associated with operating and test conditions are specified in WB-3220 and WB-3230.

WB-3120 SPECIAL CONSIDERATIONS

WB-3121 Corrosion

Design shall preclude significant corrosion, erosion, mechanical abrasion, or other material degradation.

Page 108

WB-3122 Cladding

Material metallurgically bonded to the base metal for the specific purpose of acting as a barrier to environmental attack, without a structural function, shall be referred to as cladding. No structural strength shall be attributed to the cladding. Significant loads induced by the cladding shall be considered in design of the containment component.

WB-3123 Welding

WB-3123.1 Dissimilar Welds.

In satisfying the requirements of this Subarticle, caution should be exercised in design and construction involving dissimilar metals having different coefficients of thermal expansion in order to avoid difficulties in service.

WB-3123.2 Fillet Welded Attachments.

Fillet welds conforming to Fig. WB-4427-1 may be used for attachments to components except as limited by WB-4433. Limits for primary and secondary stress intensities in the weld shall be one-half of the allowable primary and secondary stress intensities for the weaker of the materials being joined. Evaluation for cyclic loading shall be made in accordance with WB-3221.9, using a fatigue strength reduction factor of four, and shall include consideration of temperature differences between the component and the attachment, and of expansion or contraction of the component produced by internal or external pressure.

WB-3130 GENERAL DESIGN RULES

WB-3131 Scope

Design rules generally applicable to all components are provided in the following paragraphs. Specific design rules for containment components are contained in WB-3300. In case of conflict between WB-3130 and the specific design rules, the specific design rules govern.

WB-3133 Buckling and Instability

The rules applicable to evaluate the buckling and instability of containment component structural members are under development.

WB-3135 Attachments

Lugs, brackets, stiffeners, and other attachments (WB-4430) may be welded, bolted, or studded to the outside or inside of a component. The effect of attachments in producing thermal stresses, stress concentrations, and restraints on load resisting members shall be taken into account in checking for compliance with design criteria.

WB-3200 DESIGN BY ANALYSIS

WB-3210 DESIGN CRITERIA

WB-3211 Requirements for Acceptability

The requirements for the acceptability of a design by analysis are given in (a) through (d) below.

(a) The design shall be such that stress intensities will not exceed the limits described in this Subarticle and tabulated in Section II, Part D, Subpart 1, Tables 2A, 2B, and 4.

(b) The design details shall conform to the rules given in WB-3300.

(c) For configurations where compressive stresses occur, in addition to the requirements in (a) and (b) above, the critical buckling stress shall be taken into account as specified in WB-3133.

(d) Protection against nonductile fracture shall be provided. An acceptable procedure for nonductile failure prevention is given in WB-2300.

WB-3212 Basis for Determining Stresses

The theory of failure, used in the rules of this Division for combining stresses, is the maximum shear stress theory. The maximum shear stress at a point is equal to one-half the difference between the algebraically largest and the algebraically smallest of the three principal stresses at the point.

WB-3213 Terms Relating to Stress Analysis

Terms used in this Division relating to stress analysis are defined in the following subparagraphs.

WB-3213.1 Stress Intensity.¹

Stress intensity is the equivalent intensity of combined stress. The stress intensity is defined as twice the maximum shear stress. The stress intensity is the difference between the algebraically largest principal stress and the algebraically smallest principal stress at a given point. Tensile stresses are considered positive and compressive stresses are considered negative.

¹ This definition of stress intensity is not related to the definition of stress intensity applied in the field of Fracture Mechanics.

WB-3213.2 Gross Structural Discontinuity.

Gross structural discontinuity is a geometric or material discontinuity that affects the stress or strain distribution

Page 109

through the entire wall thickness of the pressure retaining member. Gross discontinuity type stresses are those portions of the actual stress distributions that produce net bending and membrane force resultants when integrated through the wall thickness. Examples of gross structural discontinuities are head-to-shell and flange-to-shell junctions, reinforcement of openings in containment shells and heads, and junctions between shells of different diameters or thicknesses.

WB-3213.3 Local Structural Discontinuity.

Local structural discontinuity is a geometric or material discontinuity that affects the stress or strain distribution through a fractional part of the wall thickness. The stress distribution associated with a local discontinuity causes only very localized types of deformation or strain and has no significant effect on the shell type discontinuity deformations.¹ Examples are small fillet radii, small attachments, and partial penetration welds.

WB-3213.4 Normal Stress.

Normal stress is the component of stress normal to the plane of reference. This is also referred to as direct stress. Usually the distribution of normal stress is not uniform through the thickness of a part, so this stress is considered to be made up in turn of two components, one of which is uniformly distributed and equal to the average value of stress across the thickness under consideration, and the other of which varies from this average value with the location across the thickness.

WB-3213.5 Shear Stress.

Shear stress is the component of stress tangent to the plane of reference.

WB-3213.6 Membrane Stress.

Membrane stress is the component of normal stress that is uniformly distributed and equal to the average value of stress across the thickness of the section under consideration.

WB-3213.7 Bending Stress.

Bending stress is the variable component of normal stress described in WB-3213.4. The variation may or may not be linear across the thickness.

WB-3213.8 Primary Stress.

Primary stress is any normal stress or a shear stress developed by an imposed loading, which is necessary to satisfy the laws of equilibrium of external and internal forces and moments. The basic characteristic of a primary stress is that it is not self-limiting. Primary stresses that considerably exceed the yield strength will result in failure or, at least, in gross distortion. Primary membrane stress is divided into general and local categories. A general primary membrane stress is one that is so distributed in the structure that no redistribution of load occurs as a result of yielding. Examples of primary stresses are:

- (a) general membrane stress in a circular cylindrical or a spherical shell due to internal pressure or to distributed live loads;
- (b) bending stress in the central portion of a flat head due to pressure;
- (c) longitudinal stress due to cylinder bending in the central portion of a horizontal cylindrical shell being decelerated by forces applied at its extreme ends.

WB-3213.9 Secondary Stress.

The basic characteristic of a secondary stress is that it is self-limiting. Local yielding and minor distortions can satisfy the conditions that cause the stress to occur and failure from one application of the stress is not to be expected. Examples of secondary stresses are:

- (a) general thermal stress [WB-3213.13(a)];
- (b) bending stress at a gross structural discontinuity.

WB-3213.10 Local Primary Membrane Stress.

Cases arise in which a membrane stress produced by pressure or other mechanical loading and associated with a primary or a discontinuity effect produces excessive distortion in the transfer of load to other portions of the structure. Conservatism requires that such a stress be classified as a local primary membrane stress even though it has some characteristics of a secondary stress. A stressed region may be considered local if the distance over which the membrane stress intensity exceeds $1.1S_m$ does not extend in the meridional direction more than $1.0\sqrt{Rt}$, where R is the minimum midsurface radius of curvature and t is the minimum thickness in the region considered. Regions of local primary stress intensity involving axisymmetric membrane stress distributions that exceed $1.1S$ shall not be closer in the meridional

direction than $2.5 \sqrt{Rt}$, where R is defined as $(R_1 + R_2)/2$ and t is defined as $(t_1 + t_2)^m/2$ (where t_1 and t_2 are the minimum thicknesses at each of the regions considered, and R_1 and R_2 are the minimum midsurface radii of curvature at these regions where the membrane stress intensity exceeds $1.1S_m$). Discrete regions of local primary membrane stress intensity, such as those resulting from concentrated loads acting on brackets, where the membrane stress intensity exceeds $1.1S_m$, shall be spaced so that there is no overlapping of the areas in which the membrane stress intensity exceeds $1.1S_m$.

WB-3213.11 Peak Stress.

Peak stress is that increment of stress that is additive to the primary plus secondary stresses by reason of local discontinuities or local thermal stress [WB-3213.13(b)], or localized application of dynamic load including the effects, if any, of stress concentrations. The basic characteristic of a peak stress is that it does not cause any noticeable

Page 110

distortion and is objectionable only as a possible source of a fatigue crack or a brittle fracture. A stress that is not highly localized falls into this category if it is of a type that cannot cause noticeable distortion. Examples of peak stresses are:

- (a) the thermal stress in the austenitic steel cladding of a carbon steel component;
- (b) certain thermal stresses, which may cause fatigue but not distortion;
- (c) the stress at a local structural discontinuity;
- (d) surface stresses produced by thermal shock.

WB-3213.12 Load and Displacement Controlled Stresses

(a) Load controlled stresses are the stresses resulting from application of a loading, such as internal pressure, inertial loads, or the effects of gravity, whose magnitude is not reduced as a result of displacement.

(b) Displacement control stresses are those stresses resulting from the application of a loading, such as a thermal stress, whose magnitude is reduced as a result of deformation.

WB-3213.13 Thermal Stress.

Thermal stress is a self-balancing stress produced by a nonuniform distribution of temperature or by differing thermal coefficients of expansion. Thermal stress is developed in a solid body whenever a volume of material is prevented from assuming the size and shape that it normally should under a change in temperature. For the purpose of establishing allowable stresses, two types of thermal stress are recognized, depending on the volume or area in which distortion takes place, as described in (a) and (b) below.

(a) General thermal stress is associated with distortion of the structure in which it occurs. If a stress of this type, neglecting stress concentrations, exceeds twice the yield strength of the material, the elastic analysis may be invalid and successive thermal cycles may produce incremental distortion. Therefore this type is classified as secondary stress in Table WB-3217-1. Examples of general thermal stresses are:

- (1) stress produced by an axial temperature distribution in a cylindrical shell;
- (2) stress produced by the temperature difference between a nozzle and the shell to which it is attached;
- (3) the equivalent linear stress² produced by the radial temperature distribution in a cylindrical shell.

2 Equivalent linear stress is defined as the linear stress distribution that has the same net bending moment as the actual stress distribution.

(b) Local thermal stress is associated with almost complete suppression of the differential expansion and thus produces no significant distortion. Such stresses shall be considered only from the fatigue standpoint and are therefore classified as local stresses in Table WB-3217-1. Examples of local thermal stresses are:

- (1) the stress in a small hot spot in a vessel wall;

(2) the difference between the actual stress and the equivalent linear stress resulting from a radial temperature distribution in a cylindrical shell;

(3) the thermal stress in a cladding material that has a coefficient of expansion different from that of the base metal.

WB-3213.14 Total Stress.

Total stress is the sum of the primary, secondary, and peak stress contributions. Recognition of each of the individual contributions is essential to establishment of appropriate stress limitations.

WB-3213.15 Operational Cycle.

Operational cycle is defined as the initiation and establishment of new conditions followed by a return to the conditions that prevailed at the beginning of the cycle. The types of operating conditions that may occur are further defined in WB-3112.

WB-3213.16 Stress Cycle.

Stress cycle is a condition in which the alternating stress difference [WB-3221.9(e)] goes from an initial value through an algebraic maximum value to an algebraic minimum value and then returns to the initial value. A single operational cycle may result in one or more stress cycles. Dynamic effects shall also be considered as stress cycles.

WB-3213.17 Fatigue Strength Reduction Factor.

Fatigue strength reduction factor is a stress intensification factor that accounts for the effect of a local structural discontinuity (stress concentration) on the fatigue strength. In the absence of experimental data, the theoretical stress concentration factor may be used.

WB-3213.18 Free End Displacement.

Free end displacement consists of the relative motions that would occur between a fixed attachment and connected piping if the two members were separated and permitted to move.

WB-3213.19 Expansion Stresses.

Expansion stresses are those stresses resulting from restraint of free end displacement of the piping system.

WB-3213.20 Deformation.

Deformation of a component part is an alteration of its shape or size.

WB-3213.23 Elastic Follow-Up.

Stresses and strains induced in a subject component caused by movements, such as thermal expansions or contractions, of much larger adjacent components, such that the subject component would yield first and thereby undergo potentially

Page 111

large plastic deformations in absorbing the deformations from the adjacent larger elastic component. These stresses are not self-limiting and have the nature of primary stresses in the subject component.

WB-3213.24 Ratcheting.

Ratcheting is a progressive incremental inelastic deformation or strain that can occur in a component that is subjected to variations of mechanical stress, thermal stress, or both.

WB-3213.25 Shakedown.

Shakedown of a structure occurs if, after a few cycles of load application, ratcheting ceases. The subsequent structural response is elastic, or elastic-plastic, and progressive incremental inelastic deformation is absent. Elastic shakedown is

the case in which the subsequent response is elastic.

WB-3214 Stress Analysis

A detailed stress analysis of all major structural components shall be prepared in sufficient detail to show that each of the stress limitations of WB-3220 and WB-3230 is satisfied when the component is subjected to the loadings of WB-3110.

WB-3215 Derivation of Stress Intensities

One requirement for the acceptability of a design (WB-3210) is that the calculated stress intensities shall not exceed specified allowable limits. These limits differ depending on the stress category (primary, secondary, etc.) from which the stress intensity is derived. This paragraph describes the procedure for the calculation of the stress intensities that are subject to the specified limits. The steps in the procedure are stipulated in (a) through (e) below.

(a) At the point on the component that is being investigated, choose an orthogonal set of coordinates, such as tangential, longitudinal, and radial, and designate them by the subscripts t , l , and r . The stress components in these directions are then designated σ_t , σ_l , and σ_r for direct stresses and τ_{lt} , τ_{lr} , and τ_{rt} for shear stresses.

(b) Calculate the stress components for each type of loading to which the part will be subjected, and assign each set of stress values to one or a group of the following categories:³

(1) general primary membrane stress P_m (WB-3213.8);

(2) local primary membrane stress P_L (WB-3213.10);

3 Membrane stress intensity is derived from the stress components averaged across the thickness of the section. The averaging shall be performed at the component level in (b) or (c).

(3) primary bending stress P_b (WB-3213.7 and WB-3213.8);

(4) expansion stress P_e (WB-3213.19);

(5) secondary stress Q (WB-3213.9);

(6) peak stress F (WB-3213.11). WB-3217 provides guidance for this step.

(c) For each category, calculate the algebraic sum of the σ_t values that result from the different types of loadings and similarly for the other five stress components. Certain combinations of the categories must also be considered.

(d) Translate the stress components for the t , l , and r directions into principal stresses σ_1 , σ_2 , and σ_3 . In many pressure component calculations, the t , l , and r directions may be so chosen that the shear stress components are zero and σ_t , σ_l , and σ_r are identical to σ_1 , σ_2 , and σ_3 .

(e) Calculate the stress differences S_{12} , S_{23} , and S_{31} from the relations:

$$S_{12} = \sigma_1 - \sigma_2$$

$$S_{23} = \sigma_2 - \sigma_3$$

$$S_{31} = \sigma_3 - \sigma_1$$

The stress intensity³ S is the largest absolute value of S_{12} , S_{23} , and S_{31} .

WB-3216 Derivation of Stress Differences⁴

If the specified operation of the component does not meet the conditions of WB-3221.9(d), the ability of the component to withstand the specified cyclic service without fatigue failure shall be determined as provided in WB-3221.9(e). The determination shall be made on the basis of the stresses at a point of the component, and the allowable stress cycles shall be adequate for the specified service at every point. Only the stress differences due to cyclic service loadings, as specified in the Design Specification, need to be considered.

WB-3216.1 Constant Principal Stress Direction.

For any case in which the directions of the principal stresses at the point being considered do not change during the cycle, the steps stipulated in (a) through (c) below shall be taken to determine the alternating stress intensity.

4 The concept of stress differences discussed in WB-3216 is essential to determination of the maximum range, since algebraic signs must be retained in the computation. Note that this limitation on range is applicable to the entire history of Normal Operating Conditions, not just to the stresses resulting from each individual transient.

(a) *Principal Stresses.* Consider the values of the three principal stresses at the point versus time for the

Page 112

complete stress cycle, taking into account both the gross and local structural discontinuities and the thermal effects, which vary during the cycle. These are designated as σ_1 , σ_2 , and σ_3 for later identification.

(b) *Stress Differences.* Determine the stress differences $S_{12} = \sigma_1 - \sigma_2$, $S_{23} = \sigma_2 - \sigma_3$, and $S_{31} = \sigma_3 - \sigma_1$ versus time for the complete cycle. In what follows, the symbol S_{ij} is used to represent any one of these three stress differences.

(c) *Alternating Stress Intensity.* Determine the extremes of the range through which each stress difference S_{ij} fluctuates and find the absolute magnitude of this range for each S_{ij} . Call this magnitude S_{rij} and let $S_{alt\ ij} = 0.5S_{rij}$. The alternating stress intensity S_{alt} is the largest $S_{alt\ ij}$ value.

WB-3216.2 Varying Principal Stress Direction.

For any case in which the directions of the principal stresses at the point being considered do change during the stress cycle, it is necessary to use the more general procedure of (a) through (e) below.

(a) Consider the values of the six stress components σ_p , σ_p , σ_p , τ_{lp} , τ_{lp} , and τ_{rt} versus time for the complete stress cycle, taking into account both the gross and local structural discontinuities and the thermal effects that vary during the cycle.

(b) Choose a point in time when the conditions are one of the extremes for the cycle (either maximum or minimum, algebraically) and identify the stress components at this time by the subscript i . In most cases, it will be possible to choose at least one time during the cycle when the conditions are known to be extreme. In some cases, it may be necessary to try different points in time to find the one that results in the largest value of alternating stress intensity.

(c) Subtract each of the six stress components σ_{ip} , σ_{ip} , etc., from the corresponding stress components σ_p , σ_p , etc., at each point in time during the cycle and call the resulting components σ'_p , σ'_p , etc.

(d) At each point in time during the cycle, calculate the principal stresses σ'_1 , σ'_2 , and σ'_3 derived from the six stress components σ'_p , σ'_p , etc. Note that the directions of the principal stresses may change during the cycle but each principal stress retains its identity as it rotates.

(e) Determine the stress differences $S'_{12} = \sigma'_1 - \sigma'_2$, $S'_{23} = \sigma'_2 - \sigma'_3$, and $S'_{31} = \sigma'_3 - \sigma'_1$ versus time for the complete cycle and find the largest absolute magnitude of any stress difference at any time. The alternating stress intensity S_{alt} is one-half of this magnitude.

WB-3217 Classification of Stresses

Table WB-3217-1 provides assistance in the determination of the category to which a stress should be assigned.

WB-3220 STRESS LIMITS FOR OTHER THAN BOLTS

WB-3221 Normal Operating Condition Limits

Normal Operating Condition Limits are those sets of limits that must be satisfied for all normal operating conditions identified in the Design Specification. The design stress intensity values S_m are given by WB-3229. The limits are summarized by Fig. WB-3221-1.

WB-3221.1 General Primary Membrane Stress Intensity.

(Derived from P_m in Fig. WB-3221-1.) This stress intensity is derived from the average value across the thickness of a section of the general primary stresses (WB-3213.8) produced by normal operating condition loads, which include internal pressure and other specified mechanical loads, but excluding all bending, local secondary, and peak stresses.

Elastic follow-up stresses shall be treated as primary stresses. Averaging is to be applied to the stress components prior to determination of the stress intensity values. The allowable value of this stress intensity is S_m at the coincident Primary Service Temperature.

WB-3221.2 Local Membrane Stress Intensity.

(Derived from P_L in Fig. WB-3221-1.) This stress intensity is derived from the average value across the thickness of a section of the local primary stresses (WB-3213.10) produced by pressure and coincident mechanical loads, but excluding all thermal and peak stresses. Elastic follow-up stresses shall be treated as primary stresses. Averaging is to be applied to the stress components prior to the determination of the stress intensity values. The limits are specified in Fig. WB-3221-1.

WB-3221.3 Primary Bending Stress Intensity.

(Derived from P_b in Fig. WB-3221-1.) Component of primary stress proportional to distance from centroid of solid section. Excludes discontinuities and concentrations. Elastic follow-up stresses shall be treated as primary stresses.

WB-3221.4 Primary Membrane and Bending Stress Intensities.

The combined stresses due to primary membrane and bending stresses developed during normal operation, with limits as shown in Fig. WB-3221-1.

WB-3221.5 Secondary Stress Intensities.

(Derived from Q in Fig. WB-3221-1.) Self-equilibrating stress

Page 113

necessary to satisfy continuity of structure, occurs at structural discontinuities. It can be caused by pressure, mechanical loads, or differential thermal expansion. Excludes local stress concentrations.

WB-3221.6 Primary Plus Secondary Stress Intensity.

This stress intensity is derived from the highest value at any point across the thickness of a section of the general or local primary membrane stresses, plus primary bending stresses plus secondary stresses, produced by the specified normal operating conditions with limits as shown in Fig. WB-3221-1.

WB-3221.7 Expansion Stress Intensity.

(Not applicable to containment shells and heads; P_e in Fig. WB-3221-1.) This stress intensity is the highest value of stress, neglecting local structural discontinuities, produced at any point across the thickness of a section by the loadings that result from restraint of free end displacement with limits as shown in Fig. WB-3221-1.

WB-3221.8 Peak Stress Intensity.

(Derived from F in Fig. WB-3221-1.) These stresses include increments added to primary or secondary stress by a concentration (notch) and certain thermal stresses, which may cause fatigue but not distortion.

WB-3221.9 Analysis for Cyclic Operation

(a) *Suitability for Cyclic Condition.* The suitability of a component for specified operation loadings involving

Page 115

cyclic application of loads and thermal conditions shall be determined by the methods described herein, except that the suitability of high strength bolts shall be determined by the methods of WB-3231.1(d), and the possibility of thermal stress ratchet shall be investigated. If the specified operating loadings of the component meet all of the conditions of (d) below, no analysis for cyclic service is required, and it may be assumed that the limits on peak stress intensities, as governed by fatigue, have been satisfied by compliance with the applicable requirements for material, design, fabrication, examination, and testing of this Division. If the operating loadings do not meet all the conditions of (d) below, a fatigue analysis shall be made in accordance with (e) below or a fatigue test shall be made in accordance with

TABLE WB-3217-1 CLASSIFICATION OF STRESS INTENSITY IN VESSELS FOR SOME TYPICAL CASES
[Note (1)]TABLE WB-3217-1 (CONT'D)
CLASSIFICATION OF STRESS INTENSITY IN VESSELS FOR SOME TYPICAL CASES [Note (1)]

Vessel Part	Location	Origin of Stress	Type of Stress	Classification
Square or rectangular vessel of flat plates	Center region	Uniform pressure	Membrane Bending	P_m P_b
	Junction between flat plates	Uniform pressure	Membrane Bending	P_L P_b
	Any section across entire vessel	Lateral internal loading	Bending across full cross section	P_m
Integral attachments and nozzles	Within the limits of reinforcement defined by WB-3334	Pressure and external loads and moments (including inertial multipliers)	General membrane	P_m
			Bending (other than gross structural discontinuity stresses) averaged through nozzle thickness	P_m
	Outside the limits of reinforcement defined by WB-3334	Pressure and external axial, shear, and torsional loads other than those attributable to restrained free end displacements of attached piping	General membrane	P_m
			Local membrane	P_L
			Bending	Q
	Nozzle wall	Gross structural discontinuities	Peak	F
			Local membrane Bending Peak	P_L Q F
Cladding	Any	Differential expansion	Membrane	F
			Bending	F
Any	Any	Radial temperature distribution [Note (4)]	Equivalent linear stress [Note (5)]	Q
			Nonlinear portion or stress distribution	F
Any	Any	Any	Stress concentration (notch effect)	F

NOTES:

- (1) Q and F classification of stresses refers to other than primary service condition (Fig. WB-3221-1).
- (2) If the bending moment at the edge is required to maintain the bending stress in the middle to acceptable limits, the edge bending is classified as P_b . Otherwise, it is classified as Q .
- (3) Consideration shall also be given to the possibility of wrinkling and excessive deformation in vessels with a large diameter-thickness ratio.
- (4) Consider possibility of thermal stress ratchet.
- (5) Equivalent linear stress is defined as the linear stress distribution that has the same net bending moment as the actual stress distribution.
- (6) The special stress limits of WB-3226 shall also be met.
- (7) Components such as concentric shells attached to each other at the ends or in close radial contact may develop stresses due to temperature differences or differential expansion between dissimilar materials. Members subjected to compressive load shall be evaluated against buckling, treating the membrane stresses as P_m .
- (8) If an end connection of two concentric shells is relatively weak, the differential thermal expansion of the shells may lead to the formation of a plastic hinge in the connection and elastic follow-up could cause excessive deformation or failure (see WB-3213.23). The end connection shall be evaluated for such a condition treating the bending stresses as P_b .

TABLE WB-3217-1 (CONT'D) CLASSIFICATION OF STRESS INTENSITY IN VESSELS FOR SOME TYPICAL CASES [Note (1)]

(b) *Peak Stress Intensity.* This stress intensity is derived from the highest value at any point across the thickness of a section of the combination of all primary, secondary, and peak stresses produced by specified operating pressures and other mechanical loads, and by general and local thermal effects associated with normal operating conditions, and including the effects of gross and local structural discontinuities.

(c) *Conditions and Procedures.* The conditions and procedures of WB-3221.9 are based on a comparison of peak stresses with strain cycling fatigue data. The strain cycling fatigue data are represented by design fatigue strength curves of Figs. I-9.0. These curves show the allowable amplitude S of the alternating stress intensity component (one-half of the alternating stress intensity range) plotted against the number of cycles. This stress intensity amplitude is calculated on the assumption of elastic behavior and, hence, has the dimensions of stress, but does not represent a real stress when the elastic range is exceeded. The fatigue curves are obtained from uniaxial strain cycling data in which the imposed strains have been multiplied by the elastic modulus and a design margin has been provided so as to make the calculated stress intensity amplitude and the allowable stress intensity amplitude directly comparable. Where necessary, the curves have been adjusted to include the maximum effects of mean stress, which is the condition where the stress fluctuates about a mean value that is different from zero. As a consequence of this procedure, it is essential that the requirements of WB-3221.6 be satisfied at all times with transient stresses included, and that the calculated value of the alternating stress intensity be proportional to the actual strain amplitude. To evaluate the effect of alternating stresses of varying amplitudes, a linear damage relation is assumed in (e)(4) below.

(d) *Components Not Requiring Analysis for Cyclic Service.* An analysis for cyclic service is not required, and it may be assumed that the limits on peak stress intensities, as governed by fatigue, have been satisfied for a component by compliance with the applicable requirements for material, design, fabrication, examination, and testing of this Division, provided the specified operating loading of the component, or portion thereof, meets all the conditions stipulated in (1) through (6) below.

(1) *Atmospheric to Operating Pressure Cycle.* The specified number of times (including startup and shutdown) that the pressure will be cycled from atmospheric pressure to service pressure and back to atmospheric pressure during normal operating does not exceed the number of cycles on the applicable fatigue curve of Figs. I-9.0 corresponding to an S_a value of three times the S_m value for the material at service temperature.

(2) *Normal Operating Pressure Fluctuation.* The specified full range of pressure fluctuations during normal operating does not exceed the quantity $\frac{1}{3} \times \text{maximum normal operating pressure} \times (S_a/S_m)$, where S_a is the value obtained from the applicable design fatigue curve for the total specified number of significant pressure fluctuations and S_m is the allowable stress intensity for the material at service temperature. If the total specified number of significant pressure fluctuations exceeds the maximum number of cycles defined on the applicable design fatigue curve, the S_a value corresponding to the curve may be used. Significant pressure fluctuations are those for which the total excursion exceeds one-third of the Maximum Normal Operating or In-Plant Handling Pressure multiplied by (S/S_m) where S is defined as follows:

(a) If the total specified number of service cycles is 10^6 cycles or less, S is the value of S_a obtained from the applicable design fatigue curve for 10^6 cycles.

(b) If the total specified number of service cycles exceeds 10^6 cycles, S is the value of S_a obtained from the applicable design fatigue curve for the maximum number of cycles defined on the curve.

⁵ As an exception to the use of strain controlled test data, Fig. I-9.2.2 of Section III, Curves B and C are based on load controlled fatigue data.

(3) *Temperature Difference - Startup and Shutdown.* The temperature difference, °F, between any two adjacent points ⁵ of the component during normal operation does not exceed $S_a/2E\alpha$, where S_a is the value obtained from the applicable design fatigue curves for the specified number of startup-shutdown cycles, α is the value of the instantaneous coefficient of thermal expansion at the mean value of the temperatures at

the two points as given by Section II, Part D, Subpart 2, Table TE, and Table E is taken from Section II, Part D, Subpart 2, Table TM at the mean value of the temperature at the two points.

(4) *Temperature Difference - Normal Operating Condition.* The temperature difference, °F, between any two adjacent points does not change during normal operation by more than the quantity $S_d/2E\alpha$, where S_d is the value obtained from the applicable design fatigue curve of Figs. I-9.0 for the total specified number of significant temperature difference fluctuations. A temperature difference fluctuation shall be considered to be significant if its total algebraic range exceeds the quantity $S/2E\alpha$, where S is defined as follows:

(a) If the total specified number of service cycles is 10^6 cycles or less, S is the value of S_d obtained from the applicable design fatigue curve for 10^6 cycles.

(b) If the total specified number of service cycles exceeds 10^6 cycles, S is the value of S_d obtained from the applicable design fatigue curve for the maximum number of cycles defined on the curve.

(5) *Temperature Difference - Dissimilar Materials.* For components fabricated from materials of differing moduli of elasticity or coefficients of thermal expansion, the total algebraic range of temperature fluctuation, °F, experienced by the component during normal operation does not exceed the magnitude $S_d/2(E_1\alpha_1 - E_2\alpha_2)$, where S_d is the value obtained from the applicable design fatigue curve for the total specified number of significant temperature fluctuations, E_1 and E_2 are the moduli of elasticity (Section II, Part D, Subpart 2, Table TM), and α_1 and α_2 are the values of the instantaneous coefficients of thermal expansion (Section II, Part D, Subpart 2, Table TE) at the mean temperature value involved for the two materials of construction. A temperature fluctuation shall be considered to be significant if its total excursion exceeds the quantity $S/2(E_1\alpha_1 - E_2\alpha_2)$, where S is defined as follows:

(a) If the total specified number of service cycles is 10^6 cycles or less, S is the value of S_d obtained from the applicable design fatigue curve for 10^6 cycles.

(b) If the total specified number of service cycles exceeds 10^6 cycles, S is the value of S_d obtained from the applicable design fatigue curve for the maximum number of cycles defined on the curve. If the two materials used have different applicable design fatigue curves, the lower value of S_d shall be used in applying the rules of this paragraph.

(6) *Mechanical Loads.* The specified full range of mechanical loads, excluding pressure but including support reactions and assembly/disassembly loads, does not result in load stresses whose range exceeds the S_d value obtained from the applicable design fatigue curve of Section III, Figs. I-9.0 for the total specified number of significant load fluctuations. If the total specified number of significant load fluctuations exceeds the maximum number of cycles defined on the applicable design fatigue curve, the S_d value corresponding to the maximum number of cycles defined on the curve may be used. A load fluctuation shall be considered to be significant if the total excursion of load stress exceeds the quantity S , where S is defined as follows:

(a) If the total specified number of service cycles is 10^6 cycles or less, S is the value of S_d obtained from the applicable design fatigue curve for 10^6 cycles.

(b) If the total specified number of service cycles exceeds 10^6 cycles, S is the value of S_d obtained from the applicable design fatigue curve for the maximum number of cycles defined on the curve.

(e) *Procedure for Analysis for Cyclic Loading.* If the specified Normal Operating Loadings for the component do not meet the conditions of WB-3221.9(d), the ability of the component to withstand the specified cyclic service without fatigue failure shall be determined as provided in this subsubparagraph. The determination shall be made on the basis of the stresses at a point, and the allowable stress cycles shall be adequate for the specified Normal Operating Loadings at every point. Only the stress differences due to service cycles as specified in the Design Specifications need be considered. Compliance with these requirements means only that the component is suitable from the standpoint of possible fatigue failure; complete suitability for the specified Normal Operating Loadings is also dependent on meeting the general stress limits of WB-3222 and any applicable special stress limits of WB-3226.

(1) *Stress Differences.* For each condition of normal operation, determine the stress differences and the alternating stress intensity S_a in accordance with WB-3216.

(2) *Local Structural Discontinuities.* These effects shall be evaluated for all conditions using stress concentration factors determined from theoretical, experimental, or photoelastic studies, or numerical stress analysis techniques. Experimentally determined fatigue strength reduction factors may be used when determined in accordance with the

procedures of Section III, II-1600, except for high strength alloy steel bolting for which the requirements of WB-3231.1(d) shall apply when using the design fatigue curve of Fig. I-9.4. Except for the case of crack-like defects, no fatigue strength reduction factor greater than five need be used.

(3) *Design Fatigue Curves.* Figs. I-9.0 contain the applicable fatigue design curves for the materials permitted by this Division. When more than one curve is presented for a given material, the applicability of

Page 117

each is identified. Where curves for various strength levels of a material are given, linear interpolation may be used for intermediate strength levels of these materials. The strength level is the specified minimum room temperature value. The design fatigue curves of Section III, Figs. I-9.0 are defined over a cyclic range of 10 to 10^6 cycles, except that for austenitic steels, nickel-chromium-iron alloys, and nickel-iron-chromium alloys, nickel-chromium-molybdenum-iron alloys, and nickel-copper alloys, the design fatigue curve is extended to 10^{11} cycles in Section III, Figs. I-9.2.2 and I-9.5. Criteria for the use of the latter curve are given in Section III, Fig. I-9.2.2 and are also presented graphically by the flow chart given in Section III, Fig. I-9.2.3.

(4) *Effect of Elastic Modulus.* Multiply S_{alt} (as determined in WB-3216.1 or WB-3216.2) by the ratio of the modulus of elasticity given on the design fatigue curve to the value of the modulus of elasticity used in the analysis. Enter the applicable design fatigue curve of Figs. I-9.0 at this value on the ordinate axis and find the corresponding number of cycles on the abscissa. If the service cycle being considered is the only one which produces significant fluctuating stresses, this is the allowable number of cycles.

(5) *Cumulative Damage.* If there are two or more types of stress cycle that produce significant stresses, their cumulative effect shall be evaluated as stipulated in Steps 1 through 6 below.

Step 1: Designate the specified number of times each type of stress cycle of types 1, 2, 3, . . . , n , will be repeated during the life of the component as $n_1, n_2, n_3, \dots, n_n$ respectively.

NOTE: In determining $n_1, n_2, n_3, \dots, n_n$, consideration shall be given to the superposition of cycles of various origins that produce a total stress difference range greater than the stress difference ranges of the individual cycles. For example, if one type of stress cycle produces 1000 cycles of a stress difference variation from zero to 1000 cycles of a stress difference variation from zero to +60,000 psi and another type of stress cycle produces 10,000 cycles of a stress difference variation from zero to -50,000 psi, the two types of cycle to be considered are defined by the following parameters:

(a) for type 1 cycle, $n_1 = 1000$ and $S_{alt 1} = (60,000 + 50,000)/2 = 55,000$ psi;

(b) for type 2 cycle, $n_2 = 9000$ and $S_{alt 2} = (50,000 + 0)/2 = 25,000$ psi.

Step 2: For each type of stress cycle, determine the alternating stress intensity S_{alt} by the procedures of WB-3216.1 or WB-3216.2 above. Call these quantities $S_{alt 1}, S_{alt 2}, S_{alt 3}, \dots, S_{alt n}$.

Step 3: For each value $S_{alt 1}, S_{alt 2}, S_{alt 3}, \dots, S_{alt n}$, use the applicable design fatigue curve to determine the maximum number of repetitions that would be allowable if this type of cycle were the only one acting. Call these values $N_1, N_2, N_3, \dots, N_n$.

Step 4: For each type of stress cycle, calculate the usage factors $U_1, U_2, U_3, \dots, U_n$ from $U_1 = n_1/N_1, U_2 = n_2/N_2, U_3 = n_3/N_3, \dots, U_n = n_n/N_n$.

Step 5: Calculate the cumulative usage factor U from $U = U_1 + U_2 + U_3 + \dots + U_n$.

Step 6: The cumulative usage factor U shall not exceed 1.0.

WB-3221.10 Deformation Limits.

Any deformation limits prescribed by the Design Specifications, such as those intended to limit leakage, shall be satisfied.

WB-3224 Hypothetical Accident Condition Limits

Hypothetical accident condition limits are those sets of limits that must be satisfied for all hypothetical accident

conditions identified in the Design Specification. The stress limits that must be satisfied for accident loads are summarized by Fig. WB-3224-1.

WB-3225 Testing Limits

The evaluation of pressure test loadings [WB-3113(a)] shall be in accordance with (a) through (c) below, except that these rules do not apply to the relief valves.

(a) The containment system shall be subjected to an internal pressure test. The primary stress produced in the containment system during the test shall not exceed 90% of the tabulated yield strength S_y at test temperature.

(b) Additional tests may be specified in the Design Specification. Stresses produced in the containment systems by such a test shall not exceed the limits specified for normal operating conditions (Fig. WB-3221-1).

(c) Tests, with the exception of either the first 10 hydrostatic tests in accordance with WB-6220, the first 10 pneumatic tests in accordance with WB-6320, or any combination of 10 such tests, shall be considered in the fatigue evaluation of the component. In this fatigue evaluation, the limits on the primary plus secondary stress intensity range (WB-3221.6) may be taken as the larger of $3S'_m$ or $2S'_y$ when at least one extreme of the stress intensity range is determined by the Test Loadings.

WB-3226 Special Stress Limits

The following deviations from the basic stress limits are provided to cover special Normal Operating Loadings

Page 118

or configurations. Some of these deviations are more restrictive, and some are less restrictive, than the basic stress limits. In cases of conflict between these requirements and the basic stress limits, the rules of WB-3226 take precedence for the particular situations to which they apply.

FIG. WB-3221-1 STRESS CATEGORIES AND LIMITS OF STRESS INTENSITY FOR NORMAL OPERATING CONDITIONS

FIG. WB-3221-1 STRESS CATEGORIES AND LIMITS OF STRESS INTENSITY FOR NORMAL OPERATING CONDITIONS

Legend: ○ = Allowable Value □ = Calculated Value

NOTES:

- (1) The symbols P_m , P_b , Q , and F do not represent single quantities, but sets of six quantities representing the six stress components: σ_1 , σ_2 , σ_3 , τ_{12} , τ_{13} , τ_{23} .
(2) For configurations where compressive stresses occur, the stress limits shall be revised to take into account critical buckling stresses [WB-3211(c)].

* Use the lesser of the values specified.

FIG. WB-3224-1 STRESS CATEGORIES AND LIMITS OF STRESS INTENSITY FOR HYPOTHETICAL ACCIDENT CONDITION

FIG. WB-3224-1 STRESS CATEGORIES AND LIMITS OF STRESS INTENSITY FOR HYPOTHETICAL ACCIDENT CONDITION

WB-3226.1 Bearing Loads

(a) The average bearing stress for resistance to crushing under the maximum load, experienced as a result of Test Loadings, or any Normal Operating Loadings, except those for which Hypothetical Accident Condition limits are designated, shall be limited to S_y at temperature, except that when the distance to a free edge is larger than the distance over which the bearing load is applied, a stress of $1.5S_y$ at temperature is permitted. For clad surfaces, the yield strength of the base metal may be used if, when calculating the bearing stress, the bearing area is taken as the lesser of the actual contact area or the area of the base metal supporting the contact surface.

(b) When bearing loads are applied near free edges, such as at a protruding ledge, the possibility of a shear failure shall be considered. In the case of load stress only (WB-3213.12), the average shear stress shall be limited to $0.6S_m$. In the case of load stress plus secondary stress (WB-3213.10), the average shear stress shall not exceed (1) or (2) below:

(1) for materials to which Note (2) of Section II, Part D, Subpart 1, Tables 2A and 2B applies, the lower of $0.5S_y$ at 100°F (38°C) and $0.675S_y$ at temperature;

(2) for all other materials, $0.5S_y$ at temperature.

For clad surfaces, if the configuration or thickness is such that a shear failure could occur entirely within the clad material, the allowable shear stress for the cladding shall be determined from the properties of the equivalent wrought material. If the configuration is such that a shear failure could occur across a path that is partially base metal and partially clad material, the allowable shear stresses for each material shall be used when evaluating the combined resistance to this type of failure.

(c) When considering bearing stresses in pins and similar members, the S_y at temperature value is applicable, except that a value of $1.5S_y$ may be used if no credit is given to bearing area within one pin diameter from a plate edge.

WB-3226.2 Pure Shear

(a) The average primary shear stress across a section loaded in pure shear, experienced as a result of Test Loadings, or any Normal Operating Condition, except those for which Hypothetical Accident Condition limits are designated (for example, keys, shear rings, screw threads), shall be limited to $0.6S_m$.

(b) The maximum primary shear that is experienced as a result of Test Loadings, or any Normal Operating Condition (except those for which Hypothetical Accident Condition limits are designated), exclusive of stress concentration, at the periphery of a solid circular section in torsion shall be limited to $0.8S_m$. Primary plus secondary and peak shear stresses shall be converted to stress intensities (equal to two times the pure shear stress) and as such shall not exceed the basic stress limits of WB-3221.6 and WB-3221.9.

WB-3226.3 Progressive Distortion of Nonintegral Connections.

Screwed on caps, screwed in plugs, shear ring closures, and breech lock closures are examples of nonintegral connections that are subject to failure by bell mouthing or other types of progressive deformation. If any combination of applied loads produces yielding, such joints are subject to ratcheting because the mating members may become loose at the end of each complete operating cycle and start the next cycle in a new relationship with each other, with or without manual manipulation. Additional distortion may occur in each cycle so that interlocking parts, such as threads, can eventually lose engagement. Therefore, primary plus secondary stress intensities (WB-3221.6), which result in slippage between the parts of a nonintegral connection in which disengagement could occur as a result of progressive distortion, shall be limited to the value S_y (Section II, Part D, Subpart 2, Table Y-1).

WB-3226.4 Triaxial Stresses.

The algebraic sum of the three primary principal stresses ($\sigma_1 + \sigma_2 + \sigma_3$) shall not exceed four times the tabulated value of S_m except for Hypothetical Accident Condition.

WB-3226.5 Applications of Elastic Analysis for Stresses Beyond the Yield Strength.

Certain of the allowable stresses permitted in the design criteria are such that the maximum stress calculated on an elastic basis may exceed the yield strength of the material. The limit on primary plus secondary stress intensity of $3S_m$ (WB-3221.6) has been placed at a level that ensures shakedown to elastic action after a few repetitions of the stress cycle, except in regions containing significant local structural discontinuities or local thermal stresses. These last two factors are considered only in the performance of a fatigue evaluation. Therefore:

(a) In evaluating stresses for comparison with the stress limits on other than fatigue allowables, stresses shall be calculated on an elastic basis.

(b) In evaluating stresses for comparison with fatigue allowables, all stresses except those that result from local

Page 121

thermal stresses [WB-3213.13(b)] shall be evaluated on an elastic basis. In evaluating local thermal stresses, the elastic equations shall be used, except that the numerical value substituted for Poisson's ratio shall be determined from the expression:

$$\nu = 0.5 - 0.2 (S_y/S_a), \text{ but not less than } 0.3$$

where

S_a

= value obtained from the applicable design fatigue curve (Figs. I-9.0) for the specified number of cycles of the condition being considered

S_y

= yield strength of the material at the mean value of the temperature of the cycle

[98]

WB-3227 Applications of Inelastic Analysis Procedures

Inelastic design rules are in preparation.

[98]

WB-3229 Design Stress Values

The design stress intensity values S_m are given in Section II, Part D, Subpart 1, Tables 2A and 2B for component materials. Values for intermediate temperatures may be found by interpolation. These form the basis for the various stress limits. Values of yield strength are given in Section II, Part D, Subpart 2, Table Y-1. Values of the coefficient of thermal expansion are in Section II, Part D, Subpart 2, Table TE, and values of the modulus of elasticity are in Section II, Part D, Subpart 2, Table TM. The basis for establishing stress values is given in Section III, Appendix III. The design fatigue curves used in conjunction with WB-3221.9 are those of Section III, Figs. I-9.0.

WB-3230 STRESS LIMITS FOR BOLTS

WB-3231 Design Conditions

(a) The number and cross-sectional area of bolts required to resist the Operating Condition loads shall be determined by analysis.

(b) When gaskets are used for pressure testing only, the design is satisfactory when the gasket factor m and the minimum design seating stress y are taken as zero.

(c) The membrane and bending stresses in the bolt produced by thermal expansion due to differences in the temperature or thermal expansion coefficients, shall be treated as primary stresses in bolting analysis.

(d) The bolting analysis shall consider "prying effects," which cause the bolts to be loaded due to rotation of the closure plate.

[98]

WB-3231.1 Normal Operating Condition Limits

(a) *Average Stress.* The membrane stress intensity averaged across the bolt cross section and neglecting stress concentrations, shall not exceed two times the stress values of Section II, Part D, Subpart 1, Table 4. In addition, the stress due to internal pressure and gasket seating shall not exceed one times the tabulated values.

(b) *Shear Stress.* The average bolt shear stress expressed in terms of available shear stress area shall not exceed $0.4S_y$.

(c) *Maximum Stress.* The maximum value of stress intensity, except as restricted by WB-3231.1(d), at the periphery of the bolt cross section resulting from direct tension plus bending and neglecting stress concentrations, shall not exceed three times the stress values of Section II, Part D, Subpart 1, Table 4.

(d) *Fatigue Analysis of Bolts.* The suitability of bolts for cyclic service shall be determined in accordance with the procedures of (1) and (2) below.

(1) *Bolting Having Less Than 100.0 ksi (689 MPa) Tensile Strength.* Bolts made of material that has specified minimum tensile strength of less than 100.0 ksi (689 MPa) shall be evaluated for cyclic service by the methods of WB-3221.9, using the applicable design fatigue curve of Section III, Figs. I-9.0 and appropriate fatigue strength reduction factor WB-3213.17.

(2) *High Strength Alloy Steel Bolting.* High strength alloy steel bolts and studs may be evaluated for cyclic service by the methods of WB-3221.9(e) using design fatigue curve of Section III, Fig. I-9.4 provided:

(a) the maximum value of the stress intensity [WB-3231.1(c)] at the periphery of the bolt cross section, neglecting stress concentration, shall not exceed $2.7S_m$ if the higher of the two fatigue design curves given in Section III, Fig. I-9.4 is used. The $2S_m$ limit for direct tension is unchanged.

(b) threads shall be of a Vee-type having a minimum thread root radius no smaller than 0.003 in. (0.08 mm);

(c) fillet radii at the end of the shank shall be such that the ratio of fillet radius to shank diameter is not less than 0.060.

(d) *Fatigue Strength Reduction Factor* (WB-3213.17). Unless it can be shown by analysis or tests that allowed value is appropriate, the fatigue strength reduction factor used in the fatigue evaluation of threaded members shall not be less than 4.0. However,

Page 122

when applying the rules of (b) above for high strength alloy steel bolts, the value used shall not be less than 4.0.

(e) *Effect of Elastic Modulus.* Multiply S_{alt} (as determined in WB-3216.2) by the ratio of the modulus of elasticity given on the design fatigue curve to the value of the modulus of elasticity used in the analysis. Enter the applicable design fatigue curve at this value on the ordinate axis and find the corresponding number of cycles on the abscissa. If the service cycle being considered is the only one that produces significant fluctuating stresses, this is the allowable number of cycles.

(f) *Cumulative Damage.* The bolts shall be acceptable for the specified cyclic application of loads and thermal stresses provided the cumulative usage factor U , as determined in WB-3221.9(e)(5), does not exceed 1.0.

[98]

WB-3231.2 Hypothetical Accident Condition Limits

(a) *Average Stress.* The membrane stress intensity averaged across the bolt cross section and neglecting stress concentrations, shall not exceed the lesser of three times the stress values of Section II, Part D, Subpart 1, Table 4 or $0.7S_m$.

(b) *Shear Stress.* The average bolt shear stress expressed in terms of available shear stress area shall not exceed the smaller of $0.42S_m$ and $0.6S_y$.

(c) *Maximum Stress.* The maximum value of stress intensity at the periphery of the bolt cross section resulting from

direct tension plus bending and neglecting stress concentrations shall not exceed three times the stress values of Section II, Part D, Subpart 1, Table 4.

(d) *Design Stress Intensity Values.* The design stress intensity values S_m are given in Section II, Part D, Subpart 1, Table 4 for bolting. Values for intermediate temperature may be found by interpolation. The basis for establishing stress intensity values is given in Section III, Appendix III.

WB-3300 CONTAINMENT VESSEL

WB-3310 GENERAL REQUIREMENTS

WB-3311 Acceptability

The requirements for acceptability of a containment vessel design are as follows.

(a) The design shall be such that the requirements of WB-3100 and WB-3200 shall be satisfied.

(b) The rules of this Subarticle shall be met. In cases of conflict between WB-3200 and WB-3300 the requirements of WB-3300 shall govern.

WB-3320 DESIGN CONSIDERATIONS

WB-3321 Normal and Hypothetical Accident Conditions

The provisions of WB-3110 apply.

WB-3322 Special Considerations

The provisions of WB-3120 apply.

WB-3323 General Design Rules

The provisions of WB-3130 apply, except when they conflict with rules of this Subarticle. In case of conflict, this Subarticle governs in the design of containment vessels.

WB-3324 Design for Local Puncture Associated With a Hypothetical Accident Condition

Regions of the containment vessel that are subject to direct impingement by the puncture bar shall be suitably designed to prevent puncture of the vessel. The allowable stress limits specified in WB-3200 do not apply in the local vicinity of direct impingement on the containment vessel shell [i.e., within the smaller distance of one and a half (1.5) diameter of the puncture bar or two times the thickness of the containment vessel shell measured from the edge of the puncture bar].

In lieu of analysis, for a 6-inch-diameter puncture bar and a 40-inch-drop, lead-shielded, multiple-layered steel containment vessel, the outer shell thickness shall not be less than:

$$(t_{req}) = (a W/S_u)^{0.71}$$

where:

W	= total weight of loaded vessel, lbs
S_u	= ultimate tensile strength of the outer shell at temperature, psi
t_{req}	= minimum outer shell thickness, in.
a	= 1.3 for vessels less than 30 in. (762 mm) in diameter; 1.0 for vessels equal to or larger than 30 in. (762 mm) in diameter

Requirements for wall thickness for other than a lead-shielded, multiple-layered steel containment vessel, in lieu of

WB-3330 OPENINGS AND REINFORCEMENT

WB-3331 General Requirements for Openings

(a) For containment vessels or parts thereof that meet the requirements of WB-3221.9(d), analysis showing satisfaction of the requirements of WB-3221.1, WB-3221.3, WB-3221.6, and WB-3221.6 in the immediate vicinity of the openings is not required for pressure loading if the rules of WB-3330 are met.

(b) For containment vessels or parts thereof that do not meet the requirements of WB-3221.9(d) so that a fatigue analysis is required, the rules contained in WB-3330 ensure satisfaction of the requirements of WB-3221.1, WB-3221.3, and WB-3221.6 in the vicinity of openings, and no specific analysis showing satisfaction of those stress limits is required for pressure loading. The requirements of WB-3221.6 may also be considered to be satisfied if, in the vicinity of an integral attachment to or a protrusion from the containment vessel, the stress intensity resulting from external nozzle loads and thermal effects, including gross but not local structural discontinuities, is shown by analysis to be less than $1.5S_m$.

(c) The provisions of (a) and (b) above are not intended to restrict the design to any specified section thicknesses or other design details, provided the basic stress limits are satisfied. If it is shown by analysis that all the stress requirements have been met, the rules of WB-3330 are waived.

(d) Openings shall be circular, elliptical, or of any other shape that results from the intersection of a circular or elliptical cylinder with a containment vessel of the shapes permitted by this Division. If fatigue analysis is not required, the restrictions on hole spacing are applicable unless there will be essentially no reaction loads at those locations.

(e) All references to dimensions apply to the finished dimensions excluding material added as corrosion allowance. Rules regarding metal available for reinforcement are given in WB-3335.

(f) Any type of opening permitted in these rules may be located in a welded joint.

WB-3332 Reinforcement Requirements for Openings in Shells and Formed Heads

WB-3332.1 Openings Not Requiring Reinforcement.

The rules for openings not requiring reinforcement are given in (a) through (c) below, where R is the mean radius and t is the nominal thickness of the vessel shell or head at the location of the opening; and *locally stressed area* means any area in the containment boundary where the primary local membrane stress exceeds $1.1S_m$ but excluding those areas where such primary local membrane stress is due to an unreinforced opening.

(a) A single opening has a diameter not exceeding $0.2\sqrt{Rt}$, or if there are two or more openings within any circle of diameter $2.5\sqrt{Rt}$, but the sum of the diameters of such unreinforced openings shall not exceed $0.25\sqrt{Rt}$.

(b) No two unreinforced openings shall have their centers closer to each other, measured on the inside of the containment vessel wall, than 1.5 times the sum of their diameters.

(c) No unreinforced opening shall have its center closer than $2.5\sqrt{Rt}$ to the edge of a locally stressed area in the containment boundary.

WB-3332.2 Required Area of Reinforcement.

The total cross-sectional area of reinforcement A , required in any given plane for a containment vessel under internal pressure, shall not be less than:

$$A = dt_r F$$

where

d

= finished diameter of a circular opening or finished dimension (chord length) of an opening on the plane being

considered for elliptical and oblong openings in corroded condition, in.

F

= a correction factor that compensates for the variation in pressure stresses on different planes with respect to the axis of a containment vessel (a value of 1.00 shall be used for all configurations, except that Fig. WB-3332.2-1 may be used for integrally reinforced openings in cylindrical shells and cones)

t_r

= the thickness that meets the requirements of WB-3221.1 in the absence of the opening, in.

Not less than half the required material shall be on each side of the center line.

WB-3333 Reinforcement Required for Openings in Flat Heads

Flat heads that have an opening with a diameter that does not exceed one-half the head diameter shall have a total cross-sectional area of reinforcement not less than that given by the formula:

$$A = 0.5dt_r$$

where d is as defined in WB-3332 and t_r is the thickness,

Page 124

in., which meets the requirements of WB-3221.1 and WB-3221.3 in the absence of the opening.

FIG. WB-3332.2-1 CHART FOR DETERMINING
VALUE OF F

FIG. WB-3332.2-1 CHART FOR DETERMINING VALUE OF F

WB-3334 Limits of Reinforcement

The boundaries of the cross-sectional area in any plane normal to the containment vessel wall and passing through the center of the opening and within which metal shall be located in order to have value as reinforcement are designated as the limits of reinforcement for that plane and are given in the following subparagraphs.

WB-3334.1 Limit of Reinforcement Along the Containment Vessel Wall.

The limits of reinforcement, measured along the midsurface of the nominal wall thickness, shall meet the following.

(a) One hundred percent of the required reinforcement shall be within a distance on each side of the axis of the opening equal to the greater of the following:

(1) the diameter of the finished opening in the corroded condition;

(2) the radius of the finished opening in the corroded condition plus the sum of the thicknesses of the containment vessel wall and the nozzle wall of any integral attachment or protrusion.

(b) Two-thirds of the required reinforcement shall be within a distance on each side of the axis of the opening equal to the greater of the following:

(1) $r + 0.5\sqrt{Rt}$, where R is the mean radius of shell or head, t is the nominal containment vessel wall thickness, and r is the radius of the finished opening in the corroded condition;

(2) the radius of the finished opening in the corroded condition plus two-thirds the sum of the thicknesses of the containment vessel wall and the wall of any integral attachment or protrusion.

WB-3335 Metal Available for Reinforcement

Metal may be counted as contributing to the area of reinforcing called for in WB-3332, provided it lies within the limits of reinforcement specified in WB-3334, and shall be limited to material that meets the following requirements:

(a) metal forming a part of the containment vessel wall, which is in excess of that required on the basis of membrane stress intensity (WB-3221.1) and is exclusive of corrosion allowance;

(b) similar excess metal in the wall of any integral attachment or protrusion, provided the item is integral with the containment vessel wall or is joined to it by a full penetration weld;

(c) weld metal that is fully continuous with the containment vessel weld;

(d) the mean coefficient of thermal expansion of metal to be included as reinforcement under (b) and (c) above shall be within 15% of the value of the containment vessel wall material;

(e) metal not fully continuous with the shell, such as that in items attached by partial penetration welds, shall not be counted as reinforcement;

(f) metal available for reinforcement shall not be considered as applying to more than one opening.

WB-3336 Strength of Reinforcing Material

Material used for reinforcement shall preferably be the same as that of the containment vessel wall. If the

Page 125

material of the wall of any integral attachment, protrusion, or reinforcement has a lower design stress intensity value S_m than that for the containment vessel material, the amount of area provided by the attachment wall protrusion or reinforcement in satisfying the requirements of WB-3332 shall be taken as the actual area provided multiplied by the ratio of the attachment wall protrusion or reinforcement design stress intensity value to the containment vessel material design stress intensity value. No reduction in the reinforcing required may be taken for the increased strength of reinforcing material or for weld metal having higher design stress intensity values than that of the material of the vessel wall. The

strength of the material at the point under consideration shall be used in fatigue analyses.

WB-3337 Attachment of Nozzles and Other Connections

WB-3337.1 General Requirements.

Category D connections (WB-3351) shall be attached to the shell or head of the containment boundary by one of the methods provided in WB-3342.

WB-3337.2 Full Penetration Welds.

Full penetration welds, as shown in Figs. WB-4244(a)-1, WB-4244(b)-1, WB-4244(c)-1, and WB-4244(e)-1, may be used (except as otherwise provided in WB-3337.3) for the purpose of achieving continuity of metal and facilitating the required radiographic examination. When all or part of the required reinforcement is attributable to the connecting item, the connecting items shall be attached by full penetration welds through either the containment shell or head, the thickness of the connecting item, or both.

WB-3337.3 Partial Penetration Welds

(a) Partial penetration welds, as shown in Figs. WB-4244(d)-1 and WB-4244(d)-2, are allowed only for connecting items on which there are substantially no reaction loads, such as openings for instrumentation. For such connecting items, all reinforcement shall be integral with the portion of the containment boundary penetrated. Partial penetration welds shall be of sufficient size to develop the full strength of the connecting items. Connecting items attached by partial penetration welds shall have an interference fit or a maximum diametral clearance between the item and the containment boundary penetration of:

(1) 0.010 in. for $d \leq 1$ in.

(2) 0.020 in. for $1 \text{ in.} < d \leq 4$ in.

(3) 0.030 in. for $d > 4$ in.

where d is the outside diameter of the item, except that the above limits on maximum clearance need not be met for the full length of the opening, provided there is a region at the weld preparation and a region near the end of the opening opposite the weld that does meet the above limits on maximum clearance, and the latter region is extensive enough (not necessarily continuous) to provide a positive stop for deflection of the connecting item.

(b) In satisfying the limit of WB-3221.6, the stress intensities resulting from pressure induced strains (dilation of hole) may be treated as secondary in the penetrating part of partial penetration welded construction, provided the requirements of WB-3342.4(d) and Fig. WB-4244(d)-1 are fulfilled.

WB-3340 DESIGN OF WELDED CONSTRUCTION

WB-3341 Welded Joint Category

The term *Category* defines the location of a joint in a containment vessel, but not the type of joint. The categories established are for use in specifying special requirements regarding joint type and degree of examination for certain welded joints. Since these special requirements, which are based on service, material, and thickness, do not apply to every welded joint, only those joints to which special requirements apply are included in the categories. The special requirements apply to joints of a given category only when specifically stated. The joints included in each category are designated as joints of Categories A, B, C, and D. Fig. WB-3341-1 illustrates typical joint locations included in each category.

WB-3341.1 Category A.

Category A comprises longitudinal welded joints within the main containment shell, transitions in diameter, any welded joint within a sphere, within a formed or flat head, or within the side plates⁶ of a flat sided containment vessel; and circumferential welded joints connecting hemispherical heads to main containment shells, or transitions in

diameters.

6 Side plates of a flat sided vessel are defined as any of the flat plates forming an integral part of the pressure retaining enclosure.

WB-3341.2 Category B.

Category B comprises circumferential welded joints within the main containment shell or transitions in diameter, including joints between the transition and a cylinder at either the large or small end; and circumferential welded joints connecting

Page 126

formed heads other than hemispherical to main shells, or to transitions in diameter.

FIG. WB-3341-1 WELDED JOINT LOCATIONS TYPICAL OF CATEGORIES A, B, C, AND D

FIG. WB-3341-1 WELDED JOINT LOCATIONS TYPICAL OF CATEGORIES A, B, C, AND D

WB-3341.3 Category C.

Category C comprises welded joints connecting flanges or flat heads to main containment shell, to formed heads, or to transitions in diameter, any welded joint connecting one side plate to another side plate of a flat sided containment vessel.

WB-3341.4 Category D.

Category D comprises welded joints connecting integral attachments or protrusions to main containment shells, to spheres, to transitions in diameter, to heads, or to flat sided containment vessels.

WB-3342 Permissible Types of Welded Joints

The design of the containment vessel shall meet the requirements for each category of joint. Butt joints are full penetration joints between plates or other elements that lie approximately in the same plane. Category B angle joints between plates or other elements that have an offset angle α not exceeding 30 deg. are considered as meeting the requirements for butt joints. Fig. WB-3341-1 shows typical butt welds for each category joint.

WB-3342.1 Joints of Category A.

All welded joints of Category A as defined in WB-3341 shall meet the fabrication requirements of WB-4241 and shall

be capable of being examined in accordance with WB-5210.

WB-3342.2 Joints of Category B.

All welded joints of Category B as defined in WB-3341 shall meet the fabrication requirements of WB-4242 and shall be capable of being examined in accordance with WB-5220. When joints with opposing lips to form an integral backing strip or joints with backing strips not later removed are used, the suitability for cyclic service shall be analyzed by the method of WB-3222.4 using a fatigue strength reduction factor of not less than 2.

WB-3342.3 Joints of Category C.

All welded joints of Category C, as defined in WB-3341, shall meet the fabrication requirements of WB-4243 and shall be capable of being examined in accordance with WB-5230. Minimum dimensions of the welds and throat thickness shall be as shown in Fig. WB-4243-1 where:

(a) for forged tubesheets, forged flat heads, and forged flanges with the weld preparation bevel angle not greater than 45 deg. measured from the face:

t, t_n	= nominal thicknesses of welded parts, in.
t_c	= $0.7t_n$ or $1/4$ in. (6 mm), whichever is less
t_w	= $t_n/2$ or $t/4$, whichever is less

(b) for all other material forms and for forged flat heads, and forged flanges with the weld preparation bevel angle greater than 45 deg. measured from the face:

t, t_n	= nominal thicknesses of welded parts, in.
t_c	= $0.7t_n$ or $1/4$ in. (6 mm), whichever is less
t_w	= t_n or $t/2$, whichever is less

WB-3342.4 Joints of Category D.

All welded joints of Category D, as defined in WB-3341, shall be in accordance with the requirements of one of (a) through (e) below.

(a) *Butt Welded Connections*. Connections shall meet the fabrication requirements of WB-4244(a) and shall be capable of being examined in accordance with WB-5242. The minimum dimensions and geometrical

Page 127

requirements of Fig. WB-4244(a)-1 shall be met, where

FIG. WB-3342-1 TYPICAL BUTT JOINTS

FIG. WB-3342-1 TYPICAL BUTT JOINTS

r_1	= $\frac{1}{4}t$ or $\frac{3}{4}$ in. (19 mm), whichever is less
r_2	= $\frac{1}{4}$ in. minimum
t	= nominal thickness of part penetrated, in.
t_n	= nominal thickness of penetrating part, in.

(b) Full Penetration Corner Welded Connections.

Connections shall meet the fabrication requirements of WB-4244(b) and shall be capable of being examined as required in WB-5243. The minimum dimensions of Fig. WB-4244(b)-1 shall be met, where

r_1	= $\frac{1}{4}t$ or $\frac{3}{4}$ in. (19 mm), whichever is less
r_2	= $\frac{1}{4}$ in. (102 mm) minimum
t	= nominal thickness of part penetrated, in.

t_c	= $0.7t_n$ or $\frac{1}{4}$ in. (6 mm), whichever is less
t_n	= nominal thickness of penetrating part, in.

(c) Use of Deposited Weld Metal for Openings and Connections

(1) Connections shall meet the fabrication requirements of WB-4244(c) and shall be capable of being examined in accordance with WB-5244.

(2) When the deposited weld metal is used as reinforcement, the coefficients of thermal expansion of the base metal, the weld metal, and the connection shall not differ by more than 15% of the lowest coefficient involved.

(3) The minimum dimensions of Fig. WB-4244(c)-1 shall be met, where

r_1	= $\frac{1}{4}t$ or $\frac{3}{4}$ in. (19 mm), whichever is less
t	= nominal thickness of part penetrated, in.
t_c	= $0.7t_n$ or $\frac{1}{4}$ in. (6 mm), whichever is less
t_n	= nominal thickness of penetrating part, in.

(4) The corners of the end of each connection extending less than $\sqrt{dt_n}$ beyond the inner surface of

Page 128

the part penetrated shall be rounded to a radius of one-half the thickness t_n of the connection or $\frac{3}{4}$ in. (19 mm), whichever is smaller.

(d) Attachment of Connections Using Partial Penetration Welds

(1) Partial penetration welds used for connections as permitted in WB-3337.3 shall meet the fabrication requirements of WB-4244(d) and shall be capable of being examined in accordance with the requirements of WB-5245.

(2) The minimum dimensions of Fig. WB-4244(d)-1 shall be met, where

d	= outside diameter of the connecting item
r_1	= $\frac{1}{4}t_n$ or $\frac{3}{4}$ in. (19 mm), whichever is less
t	= nominal thickness of part penetrated, in.
t_c	= $0.7t_n$ or $\frac{1}{4}$ in. (6 mm), whichever is less
t_n	= nominal thickness of penetrating part or the lesser of t_{n1} or t_{n2} in Fig. WB-4244(d)-2, in.

(3) The corners of the end of each connecting item, extending less than $\sqrt{dt_n}$ beyond the inner surface of the part penetrated, shall be rounded to a radius of one-half of the thickness t_n of the penetrating part or $\frac{3}{4}$ in. (19 mm), whichever is smaller.

(4) Weld groove design for partial penetration joints attaching connecting item may require special consideration to achieve the $1.25t_n$ minimum depth of weld and adequate access for welding examination. The welds shown in the sketches of Fig. WB-4244(d)-1 may be on either the inside or the outside of the containment vessel shell. Weld preparation may be J-groove, as shown in the figures, or straight bevel.

(5) A fatigue strength reduction factor of not less than four shall be used when fatigue analysis is required.

WB-3344 Structural Attachment Welds

Welds for structural attachments shall meet the requirements of WB-4430.

WB-3345

The dimensions and shape of the edges to be joined shall be such as to permit complete fusion and complete joint penetration, except as otherwise permitted in WB-3342.4.

GENERAL NOTE:
Length of taper may include the width of the weld.

FIG. WB-3351-1 CATEGORY A AND B JOINTS BETWEEN SECTIONS OF UNEQUAL THICKNESS

FIG. WB-3351-1 CATEGORY A AND B JOINTS BETWEEN SECTIONS OF UNEQUAL THICKNESS

WB-3346 Thermal Treatment

All vessels and vessel parts shall be given the appropriate postweld heat treatment prescribed in WB-4620.

WB-3350 SPECIAL CONTAINMENT VESSEL REQUIREMENTS

WB-3351 Category A or B Joints Between Sections of Unequal Thickness

In general, a tapered transition section as shown in Fig. WB-3351-1, which is a type of gross structural discontinuity (WB-3213.2), shall be provided at joints of Categories A and B between sections that differ in thickness by more than one-fourth the thickness of the thinner section. The transition section may be formed by any process that will provide a uniform taper. An ellipsoidal or hemispherical head that has a greater thickness than a cylinder of the same inside diameter may be machined to the outside diameter of the cylinder, provided the remaining thickness is at least as great as that required for a shell of the same diameter. A uniform taper is not required for flanged hubs. The adequacy of the transition shall be evaluated by stress analysis. Stress intensity limitations are given in WB-3220. The requirements of this paragraph do not apply to flange hubs.

American Society Of Mechanical Engineers

SEC III D3 WB-4000

ARTICLE WB-4000 FABRICATION AND INSTALLATION

Page 129

WB-4100 GENERAL REQUIREMENTS

WB-4110 INTRODUCTION

Components, parts, and appurtenances shall be fabricated and installed in accordance with the requirements of this Article and shall be manufactured from materials which meet the requirements of WB-2000.

WB-4120 CERTIFICATION OF MATERIALS AND FABRICATION BY CERTIFICATE HOLDER

WB-4121 Means of Certification

The Certificate Holder for an item shall certify, by application of the appropriate Code Symbol and completion of the appropriate Data Report in accordance with NCA-8000, that the materials used comply with the requirements of WB-2000 and that the fabrication or installation complies with the requirements of this Article.

WB-4121.1 Certification of Treatments, Tests, and Examinations.

If the Certificate Holder or Subcontractor performs treatments, tests, repairs, or examinations required by this Division, the Class TP Certificate Holder shall certify that this requirement has been fulfilled (WA-3862). Reports of all required treatments and of the results of all required tests, repairs, and examinations performed shall be available to the Inspector.

WB-4121.2 Repetition of Tensile or Impact Tests.

If during the fabrication or installation of the item the material is subjected to heat treatment that has not been covered by treatment of the test coupons (WB-2200) and that may reduce either tensile or impact properties below the required values, the tensile and impact tests shall be repeated by the Certificate Holder on test specimens taken from test coupons which have been taken and treated in accordance with the requirements of WB-2000.

WB-4121.3 Repetition of Surface Examination After Machining.

If, during the fabrication or installation of an item, materials for pressure containing parts are machined, then the Certificate Holder shall reexamine the surface of the material in accordance with WB-2500 when:

(a) the surface was required to be examined by the magnetic particle or liquid penetrant method in accordance with WB-2500; and

(b) the amount of material removed from the surface exceeds the lesser of $\frac{1}{8}$ in. (3.2 mm) or 10% of the minimum required thickness of the part.

WB-4122 Material Identification

(a) Material for pressure retaining parts shall carry identification markings which will remain distinguishable until the component is assembled or installed. If the original identification markings are cut off or the material is divided, the marks shall either be transferred to the parts cut or a coded marking shall be used to ensure identification of each piece of material during subsequent fabrication or installation. In either case, an as-built sketch or a tabulation of materials shall be made identifying each piece of material with the Certified Material Test Report, where applicable, and the coded marking. For studs, bolts, nuts, and heat exchanger tubes it is permissible to identify the Certified Material Test Reports for material in each component in lieu of identifying each piece of material with the Certified Material Test Report and the coded marking. Material supplied with a Certificate of Compliance, and welding and brazing material, shall be identified and controlled so that they can be traced to each component or installation of a piping system, or else a control procedure shall be employed which ensures that the specified materials are used.

Page 136

(b) Material from which the identification marking is lost shall be treated as non-conforming material until appropriate tests or other verifications are made and documented to assure material identification. Testing is required unless positive identification can be made by other documented evidence. The material may then be re-marked upon establishing positive identification.

WB-4122.1 Marking Material.

Material shall be marked in accordance with WB-2150.

WB-4123 Examinations

Visual examination activities that are not referenced for examination by other specific Code paragraphs, and are performed solely to verify compliance with requirements of WB-4000, may be performed by the persons who perform or supervise the work. These visual examinations are not required to be performed by personnel and procedures qualified to WB-5500 and WB-5100, respectively, unless so specified.

WB-4125 Testing of Welding and Brazing Material

All welding and brazing material shall meet the requirements of WB-2400.

WB-4130 REPAIR OF MATERIAL

WB-4131 Elimination and Repair of Defects

Material originally accepted on delivery in which defects exceeding the limits of WB-2500 are known or discovered during the process of fabrication or installation is unacceptable. The material may be used provided the condition is corrected in accordance with the requirements of WB-2500 for the applicable product form, except:

(a) the limitation on the depth of the weld repair does not apply;

(b) the time of examination of the weld repairs to weld edge preparations shall be in accordance with WB-5130;

(c) radiographic examination is not required for weld repairs to seal membrane material when the material thickness is $\frac{1}{4}$ in. (6 mm) or less.

WB-4132 Documentation of Repair Welds of Base Material

The Certificate Holder who makes a repair weld exceeding in depth the lesser of $\frac{3}{8}$ in. (10 mm) or 10% of the section

thickness, shall prepare a report which shall include a chart which shows the location and size of the prepared cavity, the welding material identification, the welding procedure, the heat treatment, and the examination results of repair welds.

WB-4200 FORMING, FITTING, AND ALIGNING

WB-4210 CUTTING, FORMING, AND BENDING

WB-4211 Cutting

Materials may be cut to shape and size by mechanical means, such as machining, shearing, chipping, or grinding, or by thermal cutting.

WB-4211.1 Preheating Before Thermal Cutting.

When thermal cutting is performed to prepare weld joints or edges, to remove attachments or defective material, or for any other purpose, consideration shall be given to preheating the material, using preheat schedules such as suggested in Appendix D.

WB-4212 Forming and Bending Processes

Any process may be used to hot or cold form or bend pressure retaining material (WB-4223), including weld metal, provided the required dimensions are attained (see WB-4214 and WB-4220), and provided the impact properties of the material, when required, are not reduced below the minimum specified values, or they are effectively restored by heat treatment following the forming operation. *Hot forming* is defined as forming with the material temperature higher than 100°F (38°C) below the lower transformation temperature of the material. When required, the process shall be qualified for impact properties as outlined in WB-4213. When required, the process shall be qualified to meet thickness requirements as outlined in WB-4223.1.

WB-4213 Qualification of Forming Processes for Impact Property Requirements

A procedure qualification test shall be conducted using specimens taken from material of the same specification, grade or class, heat treatment, and with similar impact properties, as required for the material in the component. These specimens shall be subjected to the equivalent forming or bending process and heat treatment as the material in the component.

Applicable tests

Page 137

shall be conducted to determine that the required impact properties of WB-2300 are met after straining.

WB-4213.1 Exemptions.

Procedure qualification tests are not required for materials listed in (a) through (f) below:

- (a) hot formed material, such as forgings, in which the hot forming is completed by the Material Organization prior to removal of the impact test specimens;
- (b) hot formed material represented by test coupons required in either WB-2211 or WB-4121.2, which have been subjected to heat treatment representing the hot forming procedure and the heat treatments to be applied to the parts;
- (c) material which does not require impact tests in accordance with WB-2300;
- (d) material which has a final strain less than 0.5%;
- (e) material where the final strain is less than that of a previously qualified procedure for that material;
- (f) material from which the impact testing is required by WB-2300 is performed on each heat and lot, as applicable, after forming.

WB-4213.2 Procedure Qualification Test.

The procedure qualification test shall be performed in the manner stipulated in (a) through (f) below.

(a) The tests shall be performed on three different heats of material both before straining and after straining and heat treatment to establish the effects of the forming and subsequent heat treatment operations.

(b) Specimens shall be taken in accordance with the requirements of WB-2000 and shall be taken from the tension side of the strained material.

(c) The percent strain shall be established by the following formulas.

For cylinders:

$$\% \text{ strain} = \frac{50t}{R_f} \left(1 - \frac{R_f}{R_o} \right)$$

For spherical or dished surfaces:

$$\% \text{ strain} = \frac{75t}{R_f} \left(1 - \frac{R_f}{R_o} \right)$$

For pipe:

$$\% \text{ strain} = \frac{100r}{R}$$

where

R	= nominal bending radius to the center line of the pipe, in.
R_f	= final radius to center line of shell, in.
R_o	= original radius (equal to infinity for a flat part), in.
r	= nominal radius of the pipe, in.
t	= nominal thickness, in.

(d) The procedure qualification shall simulate the maximum percent surface strain, employing a bending process similar to that used in the fabrication of the material or by direct tension on the specimen.

(e) Sufficient C_v test specimens shall be taken from each of the three heats of material to establish a transition curve showing both the upper and lower shelves. On each of the three heats, tests consisting of three impact specimens shall be conducted at a minimum of five different temperatures distributed throughout the transition region. The upper and lower shelves may be established by the use of one test specimen for each shelf. Depending on the product form, it may be necessary to plot the transition curves using both lateral expansion and energy level data (WB-2300). In addition, drop weight tests shall be made when required by WB-2300.

(f) Using the results of the impact test data from each of three heats, taken both before and after straining, determine either:

(1) the maximum change in *NDT* temperature along with:

(a) the maximum change of lateral expansion and energy at the temperature under consideration; or

(b) the maximum change of temperature at the lateral expansion and energy levels under consideration; or

(2) when lateral expansion is the acceptance criterion (WB-2300), either the maximum change in temperature or the maximum change in lateral expansion.

WB-4213.3 Acceptance Criteria for Formed Material.

To be acceptable, the formed material used in the component shall have impact properties before forming sufficient to compensate for the maximum loss of impact properties due to the qualified forming processes used.

WB-4213.4 Requalification.

A new procedure qualification test is required when any of the changes in (a), (b), or (c) below are made.

(a) The actual postweld heat treatment time at temperature is greater than previously qualified considering WB-2211. If the material is not postweld heat treated, the procedure must be qualified without postweld heat treatment.

Page 138

(b) The maximum calculated strain of the material exceeds the previously qualified strain by more than 0.5%.

(c) Preheat over 250°F (121°C) is used in the forming or bending operation but not followed by a subsequent postweld heat treatment.

WB-4214 Minimum Thickness of Fabricated Material

If any fabrication operation reduces the thickness below the minimum required to satisfy the rules of WB-3000, the material may be repaired in accordance with WB-4130.

WB-4220 FORMING TOLERANCES

WB-4221 Tolerance for Vessel Shells

Cylindrical, conical, or spherical shells of a completed containment vessel, except formed heads covered by WB-4222, shall meet the requirements of the following subparagraphs at all cross sections, where not further limited by design.

WB-4221.1 Maximum Difference in Cross-Sectional Diameters.

The difference in inches between the maximum and minimum diameters at any cross section shall not exceed the smaller of $(D + 50)/200$ and $D/100$, where D is the nominal inside diameter, in., at the cross section under consideration. The diameters may be measured on the inside or outside of the containment vessel. If measured on the outside, the diameters shall be corrected for the plate thickness at the cross section under consideration (Fig. WB-4221.1-1). When the cross section passes through an opening, the permissible difference in inside diameters given herein may be increased by 2% of the inside diameter of the opening.

WB-4221.2 Maximum Deviation From True Theoretical Form for External Pressure.

Containment vessels designed for external pressure shall meet the tolerances given in (a) through (c) below.

(a) The maximum plus or minus deviation from the true circular form of cylinders or the theoretical form of other shapes, measured radially on the outside or inside of the component, shall not exceed the maximum permissible deviation obtained from Fig. WB-4221.2(a)-1. Measurements shall be made from a segmental circular template having the design inside or outside radius depending on where the measurements are taken and a chord length equal to twice the arc length obtained from Fig. WB-4221.2(a)-2. For Fig. WB-4221.2(a)-1, the maximum permissible deviation e need not be less than $0.3t$. For Fig. WB-4221.2(a)-2, the arc length need not be greater than $0.30D_o$. Measurements shall not be taken on welds or other raised parts.

FIG. WB-4221.1-1 MAXIMUM DIFFERENCE IN CROSS-SECTIONAL DIAMETERS

FIG. WB-4221.1-1 MAXIMUM DIFFERENCE IN CROSS-SECTIONAL DIAMETERS

(b) The value of t , in., at any cross section is the nominal plate thickness less corrosion allowance for sections of constant thickness and the nominal thickness of the thinnest plate less corrosion allowance for sections having plates of more than one thickness.

(c) The value of L in Figs. WB-4221.2(a)-1 and WB-4221.2(a)-2 is determined by (1) through (3) below.

(1) For cylinders, L is the total length, in., of the design length of a containment vessel section, taken as the largest of the following:

- (a) the distance between head tangent lines plus one-third of the depth of each head if there are no stiffening rings;
- (b) the greatest center-to-center distance between any two adjacent stiffening rings; or
- (c) the distance from the center of the first stiffening ring to the head tangent line plus one-third of the depth of the head, all measured parallel to the axis of the vessel, in.

(2) For cones, L is the axial length of the conical section if no stiffener rings are used or, if stiffener rings are used, the axial length from the head bend line at the large end of the cone to the first stiffener ring, with D_o taken as the outside diameter in inches of the cylinder at the large end of the cone.

(3) For spheres, L is one-half of the outside diameter D_o , in.

(d) The dimensions of a completed containment vessel may be brought within the requirements by any process which will not impair the strength of the material.

(e)

FIG. WB-4221.2(a)-1 MAXIMUM PERMISSIBLE DEVIATION e FROM A TRUE CIRCULAR FORM

FIG. WB4221.2(a)-2 MAXIMUM ARC LENGTH FOR DETERMINING PLUS OR MINUS DEVIATION

FIG. WB-4221.2(a)-2 MAXIMUM ARC LENGTH FOR DETERMINING PLUS OR MINUS DEVIATION

WB-4221.3 Deviations From Tolerances.

Deviations from the tolerance requirements stipulated in WB-4221.1 and WB-4221.2 are permitted, provided the drawings are modified and deviations are reconciled with the calculations and the licensing documents. Design Documents (WA-3261) and corrective actions shall be identified in the Construction Report [WA-3561(b)].

WB-4221.4 Tolerance Deviations for Vessel Parts Fabricated From Pipe.

Vessel parts subjected to either internal or external pressure and fabricated from pipe, meeting all other requirements of this Division, may have variations of diameter and deviations from circularity permitted by the specification for such pipe.

WB-4221.5 Localized Thin Areas.

Localized thin areas are permitted if the adjacent areas surrounding each have sufficient thickness to provide the necessary reinforcement according to the rules for reinforcement in WB-3330.

WB-4222 Tolerances for Formed Vessel Heads

The tolerance for formed vessel heads shall be as set forth in the following subparagraphs.

WB-4222.1 Maximum Difference in Cross-Sectional Diameters.

The skirt or cylindrical end of a formed head shall be circular to the extent that the difference in inches between the maximum and minimum diameters does not exceed the lesser of $(D + 50)/200$ and $(D + 12)/100$, where D is the nominal inside diameter, in., and shall match the cylindrical edge of the adjoining part within the alignment tolerance specified in WB-4232.

WB-4222.2 Deviation From Specified Shape

(a) The inner surface of a torispherical or ellipsoidal head shall not deviate outside the specified shape by more than $1\frac{1}{4}\%$ of D , inside the specified shape by more than $\frac{5}{8}\%$ of D , where D is the nominal inside diameter of the vessel. Such deviations shall be measured perpendicular to the specified shape and shall not be abrupt. The knuckle radius shall not be less than specified. For 2:1 ellipsoidal heads, the knuckle radius may be considered to be 17% of the diameter of the vessel.

(b) Hemispherical heads and any spherical portion of a formed head shall meet the local tolerances for spheres as given in WB-4221.2, using L as the outside spherical radius, in., and D_o as two times L .

(c) Deviation measurements shall be taken on the surface of the base material and not on welds.

WB-4223 Tolerances for Formed or Bent Piping

The tolerances for formed or bent piping shall be as set forth in the following subparagraphs.

WB-4223.1 Minimum Wall Thickness

(a) In order to assure that the wall thickness requirements of the design calculations are met, the actual thickness shall be measured, or the process shall be qualified by demonstrating that it will maintain the required wall thickness.

(b) As an alternative to (a) above, the requirements of Table WB-3642.1(b)-1 shall be followed.

WB-4223.2 Ovality Tolerance.

Unless otherwise justified by the Design Report, the ovality of piping after bending shall not exceed 8% as determined by:

$$100 \times (D_{\max} - D_{\min})/D_o$$

where

D_o

= nominal pipe outside diameter, in.

$D_{\min}$

= minimum outside diameter after bending or forming, in.

$D_{\max}$

= maximum outside diameter after bending or forming, in.

WB-4230 FITTING AND ALIGNING

WB-4231 Fitting and Aligning Methods

Parts that are to be joined by welding may be fitted, aligned, and retained in position during the welding operation by the use of bars, jacks, clamps, tack welds, or temporary attachments.

WB-4231.1 Tack Welds.

Tack welds used to secure alignment shall either be removed completely, when they have served their purpose, or their stopping and starting ends shall be properly prepared by grinding or other suitable means so that they may be satisfactorily incorporated into the final weld. Tack welds shall be made by qualified welders using qualified welding procedures. When tack welds are to become part of the finished weld, they shall be visually examined and defective tack welds shall be removed.

WB-4232 Alignment Requirements When Components Are Welded From Two Sides

(a) Alignment of sections which are welded from two sides shall be such that the maximum offset of the finished weld will not be greater than the applicable

Page 142

amount listed in Table WB-4232-1, where t is the nominal thickness of the thinner section at the joint.

TABLE WB-4232-1
MAXIMUM ALLOWABLE OFFSET IN
FINAL WELDED JOINTS

Section Thickness, in.	Direction of Joints	
	Longitudinal	Circumferential
Up to $\frac{1}{2}$, incl.	$\frac{1}{4}t$	$\frac{1}{4}t$
Over $\frac{1}{2}$ to $\frac{3}{4}$, incl.	$\frac{1}{8}$ in.	$\frac{1}{4}t$
Over $\frac{3}{4}$ to $1\frac{1}{2}$, incl.	$\frac{1}{8}$ in.	$\frac{3}{16}$ in.
Over $1\frac{1}{2}$ to 2, incl.	$\frac{1}{8}$ in.	$\frac{1}{8}t$
Over 2	Lesser of $\frac{1}{16}t$ or $\frac{3}{8}$ in.	Lesser of $\frac{1}{16}t$ or $\frac{3}{8}$ in.

TABLE WB-4232-1 MAXIMUM ALLOWABLE OFFSET IN FINAL WELDED JOINTS

(b) Joints in spherical vessels, joints within heads, and joints between cylindrical shells and hemispherical heads shall meet the requirements in Table WB-4232-1 for longitudinal joints.

WB-4232.1 Fairing of Offsets.

Any offset within the allowable tolerance provided above shall be faired to at least a 3:1 taper over the width of the finished weld or, if necessary, by adding additional weld metal beyond what would otherwise be the edge of the weld. In addition, offsets greater than those stated in Table WB-4232-1 are acceptable provided the requirements of WB-3200 are met.

WB-4233 Alignment Requirements When Inside Surfaces Are Inaccessible

(a) When the inside surfaces of items are inaccessible for welding or fairing in accordance with WB-4232, alignment of sections shall meet the requirements of (1) and (2) below:

(1)(a) For circumferential joints the inside diameters shall match each other within $\frac{1}{16}$ in. (1.6 mm). When the items are aligned concentrically, a uniform mismatch of $\frac{1}{32}$ in. (0.8 mm) all around the joint can result as shown in Fig. WB-4233(a)-1 sketch (a). However, other variables not associated with the diameter of the item often result in alignments that are offset rather than concentric. In these cases, the maximum misalignment at any one point around the joint shall not exceed $\frac{3}{32}$ in. (2.4 mm) as shown in Fig. WB-4233(a)-1 sketch (b). Should tolerances on diameter, wall thickness, out-of-roundness, etc., result in inside diameter variations which do not meet these limits, the inside diameters shall be counterbored, sized, or ground to produce a bore within these limits, provided the requirements of WB-4250 are met.

(b) Offset of outside surfaces shall be faired to at least a 3:1 taper over the width of the finished weld or, if necessary,

by adding additional weld metal.

(2) For longitudinal joints the misalignment of inside surfaces shall not exceed $\frac{3}{32}$ in. (2.4 mm) and the offset of outside surfaces shall be faired to at least a 3:1 taper over the width of the finished weld or, if necessary, by adding additional weld metal.

(b) Single welded joints may meet the alignment requirements of (a)(1) and (a)(2) above in lieu of the requirements of WB-4232.

WB-4240 REQUIREMENTS FOR WELD JOINTS IN COMPONENTS

WB-4241 Category A Weld Joints in Vessels and Longitudinal Weld Joints in Other Components

Category A weld joints in vessels and longitudinal weld joints in other components shall be full penetration butt joints. Joints that have been welded from one side with backing that has been removed and those welded from one side without backing are acceptable as full penetration welds provided the weld root side of the joints meets the requirements of WB-4424.

WB-4242 Category B Weld Joints in Vessels and Circumferential Weld Joints in Other Components

Category B weld joints in vessels and circumferential weld joints in other components shall be full penetration butt joints, except that piping NPS 2 (DN 50) and smaller may be socket welded. When used, backing strips shall be continuous in cross section. Joints prepared with opposing lips to form an integral backing strip and joints with backing strips which are not later removed are acceptable provided the requirements of WB-3342.2 are met.

WB-4243 Category C Weld Joints in Vessels and Similar Weld Joints in Other Components

Category C weld joints in vessels and similar weld joints in other components shall be full penetration joints, except that NPS 2 (DN 50) and smaller socket welded joints may be used on component nozzles and in piping. Joints that have been welded from one side with backing that has been removed and those welded

Page 143

from one side without backing are acceptable as full penetration welds provided the weld root side of the joints meets the requirements of WB-4424. Either a butt welded joint or a full penetration corner joint as shown in Fig. WB-4243-1 shall be used.

(a) Concentric Center Lines

(b) Offset Center Lines

GENERAL NOTE:
The weld transitions are typical and are not intended as requirements. Refer to WB-4250 for weld end transition requirements.

FIG. WB-4233(a)-1 BUTT WELD ALIGNMENT AND MISMATCH TOLERANCES FOR UNEQUAL I.D. AND O.D. WHEN COMPONENTS ARE WELDED FROM ONE SIDE AND FAIRING IS NOT PERFORMED

FIG. WB-4233(a)-1 BUTT WELD ALIGNMENT AND MISMATCH TOLERANCES FOR UNEQUAL I.D. AND O.D. WHEN COMPONENTS ARE WELDED FROM ONE SIDE AND FAIRING IS NOT PERFORMED

WB-4244 Category D Weld Joints in Vessels and Branch Piping Weld Joints in Other Components

Category D weld joints in vessels and similar weld joints in other components shall be full or partial penetration weld joints using one of the details of (a) through (e) below.

(a) *Butt Welded Nozzles and Branch Piping Connections.* Nozzles and branch piping connections shall be attached by full penetration butt welds through the wall of the component, nozzle, or branch as shown in Fig. WB-4244(a)-1. Backing strips, if used, shall be removed.

(b) *Corner Welded Nozzles and Branch Piping Connections.* Nozzles and branch piping connections shall be joined to the component by full penetration welds through the wall of the component, nozzle, or branch similar to those shown in Fig. WB-4244(b)-1. Backing strips, if used, shall be removed.

(c) *Deposited Weld Metal of Openings for Nozzles and Branch Piping Connections.* Nozzles and branch piping connections shall be joined to the component by full penetration weld to built-up weld deposits applied to the component, nozzle, or branch as shown in Fig. WB-4244(c)-1. Backing strips, if used, shall be removed. Fillet welds shall be used only to provide a transition between the parts joined or to provide a seal. The fillet welds, when used, shall be finished by grinding to provide a smooth surface having a transition radius at its intersection with either part being joined.

(d) *Partial Penetration Welded Nozzles and Branch Piping Connections.* Partial penetration welds in components and branch piping connections shall meet the weld design requirements of WB-3342.4(d) for vessels or WB-3643 for piping branch connections. Nozzles shall be attached as shown in Figs. WB-4244(d)-1 and WB-4244(d)-2.

(e) *Oblique Nozzles and Piping Connections.* Oblique nozzles and piping connections shall be joined to the component by full penetration welds through the nozzle or pipe connections as shown in Fig. WB-4244(e)-1. Backing rings, if used, shall be removed.

WB-4250 WELDING END TRANSITIONS - MAXIMUM ENVELOPE

The welding ends of items shall provide a gradual change in thickness from the item to the adjoining item. Any welding end transition which lies entirely within the envelope shown in Fig. WB-4250-1 is acceptable provided:

- (a) the wall thickness in the transition region is not less than the minimum wall thickness of the adjoining pipe; and
- (b) sharp reentrant angles and abrupt changes in slope in the transition region are avoided. When the included angle between any two adjoining surfaces of a taper transition is less than 150 deg., the intersection or corner (except for the weld reinforcement) shall be provided with a radius of at least $0.05t_{\min}$.

WB-4300 WELDING QUALIFICATIONS

WB-4310 GENERAL REQUIREMENTS

WB-4311 Types of Processes Permitted

Only those welding processes which are capable of producing welds in accordance with the welding procedure qualification requirements of Section IX and this Division may be used for welding pressure retaining material or attachments thereto. Any process used shall be such that the records required by WB-4320 can be prepared, except that records for stud welds shall be traceable to the welders and welding operators and not necessarily to each specific weld.

WB-4311.1 Stud Welding Restrictions.

Stud welding is acceptable only for nonstructural and temporary attachments (WB-4435). Studs shall be limited to 1 in. (25 mm) maximum diameter for round studs and an equivalent cross-sectional area for studs of other shapes when welding in the flat position and $\frac{3}{4}$ in. (19 mm) diameter for all other welding positions. Postweld heat treatment shall

comply with WB-4600, except that time at temperature need not exceed $\frac{1}{2}$ hr regardless of base material thickness. Welding procedure and performance qualification shall comply with the requirements of Section IX.

WB-4311.2 Capacitor Discharge Welding.

Capacitor discharge welding may be used for welding temporary attachments and permanent nonstructural attachments provided:

Page 145

Page 146

FIG. WB-4243-1 ACCEPTABLE FULL PENETRATION WELD DETAILS FOR CATEGORY C JOINTS (WB-3342.3)

FIG. WB-4243-1 ACCEPTABLE FULL PENETRATION WELD DETAILS FOR CATEGORY C JOINTS (

GENERAL NOTES:

- (a) For definitions of symbols, see WB-4244 for vessels and NB-3643 for piping.
 (b) Reinforcement may be distributed within the limits prescribed by the Code.

FIG. WB-4244(a)-1 NOZZLE, BRANCH, AND PIPING CONNECTIONS JOINED BY FULL PENETRATION BUTT WELDS

FIG. WB-4244(a)-1 NOZZLE, BRANCH, AND PIPING CONNECTIONS JOINED BY FULL PENETRATION BUTT WELDS

GENERAL NOTE: For definitions of symbols, see WB-4244.4 for vessels and NB-3643 for piping.

FIG. WB-4244(b)-1 NOZZLE, BRANCH, AND PIPING CONNECTIONS JOINED BY FULL PENETRATION CORNER WELDS

GENERAL NOTE: For definitions of symbols, see NB-3352.4(c) for vessels and NB-3643 for piping.

FIG. WB-4244(c)-1 DEPOSITED WELD METAL USED AS REINFORCEMENT OF OPENINGS FOR NOZZLE AND PIPING CONNECTIONS

GENERAL NOTES:

- (a) Weld deposit reinforcement, if used, shall be examined as required in WB-5244.
- (b) The $3/4 t_n$ min. dimension applies to the fillet leg and the J-groove depth.
- (c) Weld groove design for oblique nozzles of this type requires special consideration to achieve the $1.25 t_n$ minimum depth of weld and adequate access for welding inspection. With due regard to the requirements in Fig. WB-4244(c)-1, the welds shown in the sketches may be on either the inside or the outside. Weld preparation may be J-groove as shown or straight bevel. If weld deposit reinforcement is not used, r shall apply to I.D. of base material instead of I.D. of weld buildup.
- (d) For definitions of symbols, see NB-3352.4(d) for vessels and NB-3643 for piping.

FIG. WB-4244(d)-1 PARTIAL PENETRATION NOZZLE AND PIPING CONNECTIONS

FIG. WB-4244(d)-2 PARTIAL PENETRATION NOZZLE FOR COAXIAL CYLINDERS

FIG. WB-4244(d)-2 PARTIAL PENETRATION NOZZLE FOR COAXIAL CYLINDERS

GENERAL NOTES:
 (a) Step 1 examination required before assembly.
 (b) For definitions of symbols, see NB-3352.4(e) for vessels and NB-3643 for piping.

FIG. WB-4244(e)-1 OBLIQUE CONNECTIONS

GENERAL NOTES:

- (a) Weld bevel is shown for illustration only.
- (b) The weld reinforcement permitted by NC-4426 may lie outside the maximum envelope.

NOTES:

- (1) The value $t_{min.}$ is whichever of the following is applicable:
 - (a) the minimum ordered wall thickness of the pipe;
 - (b) 0.875 times the nominal wall thickness of pipe ordered to a pipe schedule wall thickness which has an under tolerance of 12.5%;
 - (c) the minimum ordered wall thickness of the cylindrical welding end of a component or fitting (or the thinner of the two) when the joint is between two components.
- (2) The maximum thickness at the end of the component is:
 - (a) the greater of $t_{min.} + 0.15$ in. or $1.15 t_{min.}$ when ordered on a minimum wall basis;
 - (b) the greater of $t_{min.} + 0.15$ in. or $1.0 t_{nom.}$ when ordered on a nominal wall basis.

FIG. WB-4250-1 WELDING END TRANSITIONS — MAXIMUM ENVELOPE

FIG. WB-4250-1 WELDING END TRANSITIONS - MAXIMUM ENVELOPE

- (a) temporary attachments are removed in accordance with the provisions of WB-4435(b); and
- (b) the energy output for permanent nonstructural attachments such as strain gages and thermocouples is limited to 125 W-sec, and the minimum thickness of the material to which the attachment is made is greater than 0.09 in. (2.3 mm); and
- (c) a Welding Procedure Specification is prepared describing the capacitor discharge equipment, the combination of materials to be joined, and the technique of application; qualification of the welding procedure is not required.

WB-4311.4 Inertia and Continuous Drive Friction Welding

- (a) Inertia and continuous drive friction welding shall not be used for the fabrication of vessels and piping.
- (b) The weld between the two members shall be a full penetration weld.

WB-4320 WELDING QUALIFICATIONS, RECORDS, AND IDENTIFYING STAMPS

WB-4321 Required Qualifications

- (a) Each Certificate Holder is responsible for the welding done by his organization, and each Certificate Holder shall establish the procedure and conduct the tests required by this Article and by Section IX in order to qualify both the welding procedures and the performance of welders and welding operators who apply these procedures.
- (b) Procedures, welders, and welding operators used to join permanent or temporary attachments to pressure parts and to make permanent or temporary tack welds used in such welding shall also meet the qualification requirements of this Article.
- (c) When making procedure test plates for butt welds, consideration shall be given to the effect of angular, lateral, and end restraint on the weldment. This applies particularly to material and weld metal of 80.0 ksi (552 MPa) tensile strength or higher and heavy sections of both low and high tensile strength material. The addition of restraint during welding may result in cracking difficulties that otherwise might not occur.
- (d) WA-3131 provides specific additional requirements when welding services are subcontracted to or through organizations not holding an appropriate Certificate of Accreditation.

WB-4322 Maintenance and Certification of Records

The Certificate Holder shall maintain a record of the qualified welding procedures and of the welders and welding operators qualified by him, showing the date and results of tests and the identification mark assigned to each welder. These records shall be reviewed, verified, and signed by any authorized individual assigned by the Certificate Holder, and they shall be accessible to the Owner and to the Inspector.

WB-4322.1 Identification of Joints by Welder or Welding Operator

- (a) Each welder or welding operator shall apply the identification mark assigned by the Certificate Holder on or adjacent to all permanent welded joints or series of joints on which he welds. The marking shall be at intervals of 3 ft or less and shall be done with either blunt nose continuous or blunt nose interrupted dot die stamps. As an alternative, the Certificate Holder shall keep a record of permanent welded joints in each item and of the welders and welding operators used in making each of the joints.
- (b) When a multiple number of permanent structural attachment welds, nonstructural welds, fillet welds, socket welds, welds of specially designed seals, weld metal cladding, hard surfacing, and tube-to-tubesheet welds are made on an item, the Certificate Holder need not identify the welder or welding operator who welded each individual joint, provided:
 - (1) the Certificate Holder maintains a system that will identify the welders or welding operators who made such welds on each item so that the Inspector can verify that the welders or welding operators were all properly qualified;
 - (2) the welds in each category are all of the same type and configuration and are welded with the same Welding Procedure Specification.

WB-4323 Welding Prior to Qualifications

No welding shall be undertaken until after the welding procedures which are to be used have been qualified. Only welders and welding operators who are qualified in accordance with WB-4320 and Section IX shall be used.

WB-4324 Transferring Qualifications

The welding procedure qualifications and the performance qualification tests for welders and welding operators conducted by one Certificate Holder shall not qualify welding procedures and shall not qualify welders

Page 154

or welding operators to weld for any other Certificate Holder, except as provided in Section IX, QW-201 and QW-300.2.

WB-4330 GENERAL REQUIREMENTS FOR WELDING PROCEDURE QUALIFICATION TESTS

WB-4331 Conformance to Section IX Requirements

All welding procedure qualification tests shall be in accordance with the requirements of Section IX as supplemented or modified by the requirements of this Article.

WB-4333 Heat Treatment of Qualification Welds for Ferritic Materials

Postweld heat treatment of procedure qualification welds shall conform to the applicable requirements of WB-4600 and Section IX. The postweld heat treatment time at temperature shall be at least 80% of the maximum time to be applied to the component weld material. The postweld heat treatment total time may be applied in one heating cycle.

WB-4334 Preparation of Test Coupons and Specimens

(a) Removal of test coupons from the test weld and the dimensions of specimens made from them shall conform to the requirements of Section IX, except that the removal of impact test coupons and the dimensions of impact test specimens shall be in accordance with (b) below.

(b) Weld deposit of each process in a multiple process weld shall, where possible, be included in the impact test specimens. When each process cannot be included in the full-size impact test specimen at the $\frac{1}{4}t$ location required by this Division, additional full-size specimens shall be obtained from locations in the test weld that will ensure that at least a portion of each process has been included in full-size test specimens. As an alternative, additional test welds can be made with each process so that full-size specimens can be tested for each process.

WB-4334.1 Coupons Representing the Weld Deposit.

Impact test specimens and testing methods shall conform to WB-2321. The impact specimen shall be located so that the longitudinal axis of the specimen is at least $0.25t$ and, where the thickness of the test assembly permits, not less than $\frac{3}{8}$ in. (10 mm) from the weld surface of the test assembly. In addition, when the postweld heat treatment temperature exceeds the maximum temperature specified in WB-4620 and the test assembly is cooled at an accelerated rate, the longitudinal axis of the specimen shall be a minimum of t from the edge of the test assembly. The specimen shall be transverse to the longitudinal axis of the weld with the area of the notch located in the weld. The length of the notch of the Charpy V-notch specimen shall be normal to the surface of the weld. Where drop weight specimens are required, the tension surface of the specimen shall be oriented parallel to the surface of the test weld assembly.

WB-4334.2 Coupons Representing the Heat Affected Zone.

Where impact tests of the heat affected zone are required by WB-4335.2, specimens shall be taken from the welding procedure qualification test assemblies in accordance with (a) through below.

(a) If the qualification test material is in the form of a plate or a forging, the axis of the weld shall be oriented in the direction parallel to the principal direction of rolling or forging.

(b) The heat affected zone impact test specimens and testing methods shall conform to the requirements of WB-2321.2. The specimens shall be removed from a location as near as practical to a depth midway between the surface and center

thickness. The coupons for heat affected zone impact specimens shall be taken transverse to the axis of the weld and etched to define the heat affected zone. The notch of the Charpy V-notch specimen shall be cut approximately normal to the material surface in such a manner as to include as much heat affected zone as possible in the resulting fracture. Where the material thickness permits, the axis of a specimen may be inclined to allow the root of the notch to align parallel to the fusion line. When a grain refining heat treatment is not performed on welds made by the electroslog or electrogas welding process, the notch for the impact specimens shall be located in the grain coarsened region.

(c) For the comparison of heat affected zone values with base material values [WB-4335.2(b)], Charpy V-notch specimens shall be removed from the unaffected base material at approximately the same distance from the base material surface as the heat affected zone specimens. The axis of the unaffected base material specimens shall be parallel to the axis of the heat affected zone specimens, and the axis of the notch shall be normal to the surface of the base material. When required by WB-4335.2(b)(1), drop-weight specimens shall be removed from a depth as near as practical

Page 155

to midway between the surface and center thickness of the unaffected base material and shall be tested in accordance with the requirements of WB-2321.1.

WB-4335 Impact Test Requirements

When materials are required to be impact tested per WB-2300, impact tests of the weld metal and heat affected zone shall be performed in accordance with the following subparagraphs. The weld procedure qualification impact test specimens shall be prepared and tested in accordance with the applicable requirements of WB-2330 and WB-4334. Retests in accordance with the provisions of WB-2350 are permitted.

WB-4335.1 Impact Tests of Weld Metal

(a) Impact tests of the weld metal shall be required for welding procedure qualification tests for production weld joints exceeding $\frac{5}{8}$ in. (16 mm) in thickness when the weld will be made on the surface or penetrate base material that requires impact testing in accordance with WB-2310. In addition, such testing of the weld metal is required for the welding procedure qualification tests for any weld repair to base material that requires impact testing in accordance with WB-2310, regardless of the depth of the repair. Exemption from impact testing under WB-2311(a) does not apply to weld metal of welding procedure qualification tests for either production weld joints or base metal repairs unless the specific weld metal used is A-No. 8.

(b) The impact test requirements and acceptance standards for welding procedure qualification weld metal shall be the same as specified in WB-2330 for the base material to be welded or repaired. Where two materials are to be joined by welding and have different fracture toughness requirements, the test requirements and acceptance standards of either material may be used for the weld metal except where this is otherwise specified by WA-1280 or other parts of this Subsection.

(c) Impact tests are not required for austenitic and nonferrous weld metal.

(d) A Welding Procedure Specification qualified to the impact testing requirements of Subsection NB or NE may be accepted as an alternative to the Welding Procedure Specification impact testing requirements of this Division.

WB-4335.2 Impact Tests of Heat Affected Zone

(a) Charpy V-notch tests of the heat affected zone of the welding procedure qualification test assembly are required whenever the thickness of the weld exceeds $\frac{5}{8}$ in. (16 mm) and either of the base materials require impact testing in accordance with the rules of WB-2310. Exemption of base materials by WB-2311(a) does not apply to the welding procedure qualification heat affected zone or unaffected base material for such materials. The only exceptions to the requirements are the following:

(1) the qualification for welds in P-Nos. 1 and 3 and SA-336 F12 materials that are postweld heat treated and are made by any process other than electroslog, electrogas, or thermit;

(2) the qualification for weld deposit cladding.

(b) Impact testing of the welding procedure qualification test heat affected zone, where required by WB-4335 shall be conducted in accordance with (b)(1) through (b)(3), or (b)(4) through (b)(6), and (c), if applicable.

(1) For tests of welding procedure qualifications for material that requires testing in accordance with WB-2331.1, the three Charpy V-notch heat affected zone specimens and three Charpy V-notch unaffected base material specimens shall be tested at a temperature in accordance with WB-2331.1(a)(1). The Charpy V-notch impact tests of the unaffected base material shall meet the requirements of Table WB-2331.2-1 or Table WB-2331.2-2. If the average lateral expansion values of the three HAZ specimens are equal to or greater than the average value for the unaffected base material Charpy V-notch specimens, the qualification test shall be considered acceptable, and the values and testing temperature shall be recorded on the Welding Procedure Qualification Record.

(2) If the heat affected zone Charpy V-notch average toughness values of (b)(1) above is less than that for the unaffected base material, and the qualification test meets the other criteria of acceptance, the Charpy V-notch test results may be recorded on the Welding Procedure Qualification Record. Data shall then be obtained as specified in (b)(3) below to provide an additive temperature for the adjustment of the lowest service temperature (LST) of the base material that is to be welded in production with the welding procedure that is being qualified. Alternatively, the welding procedure qualification may be rewelded and retested.

(3) The data for use in (b)(2) above shall be developed by performing additional Charpy V-notch tests on either the welding procedure qualification heat affected zone or the unaffected base material, or both, at temperatures which provide toughness values that meet or exceed those required for the thickness or thickness-strength combination of the material to be welded in production. The toughness data for the heat affected zone and unaffected base material shall be plotted on a property temperature chart. The temperatures at which these two sets of data exhibit a common acceptable value of toughness for the production thickness

Page 156

or thickness-strength combination involved shall be determined. The determined temperature for the unaffected base material shall be subtracted from the similarly determined temperature for the heat affected zone. This difference shall be used in (b)(2) above as the adjustment temperature. The adjustment temperature shall be added to the highest LST established by the tests of WB-2331.1 for all of the base material to be welded by this procedure in production. If the temperature difference is zero or is a negative number, no adjustment is required for the base material to be welded in production, and the minimum temperature established by the tests for WB-2331.1 will still apply as stated in (b)(1) above. Where the actual LRT is not required for the production material to be welded, for example, where a testing temperature is established by the Design Specification to determine that the material has adequate toughness to meet the requirements at the specified test temperature, the adjustment temperature determined by the curves shall be used to establish a reduction in the specified testing temperature for the production material. The adjustment temperature shall be used to lower the specified testing temperature for any production material on which the procedure will be used.

(4) For tests of welding procedure qualifications for materials that require tests in accordance with WB-2332(a), the three Charpy V-notch heat affected zone specimens and three Charpy V-notch unaffected base material specimens shall be tested at a temperature lower than or equal to the LST. The Charpy V-notch impact test of the unaffected base material shall meet or exceed the applicable over $2\frac{1}{2}$ in. (64 mm) thickness requirements of Table WB-2331.2-1 or Table WB-2331.2-2. If the average lateral expansion values of the three heat affected zone specimens are equal to or greater than the average value of the unaffected base material Charpy V-notch specimens, the test shall be considered acceptable, and the values and testing temperature shall be recorded on the Welding Procedure Qualification Record.

(5) If the average Charpy V-notch toughness value for the heat affected zone of (b)(4) above is less than the unaffected base material and the welding procedure qualification test meets the other criteria of acceptance, the Charpy V-notch test results may be recorded on the Welding Procedure Qualification Record. Data shall then be obtained as specified in (b)(6) below to provide an additive temperature for the adjustment of the lowest service temperature of the base material that is to be welded in production with the welding procedure that is being qualified. Alternatively, the welding procedure qualification may be rewelded and retested.

(6) The data for use in (b)(5) above shall be developed by performing additional Charpy V-notch tests on either the welding procedure qualification heat affected zone or the unaffected base material, or both, at temperatures which provide toughness values equal to or greater than the applicable over $2\frac{1}{2}$ in. (64 mm) thickness requirements of Table WB-2331.2-1 or Table WB-2331.2-2. The average toughness data for the heat affected zone and unaffected base material shall be plotted on a property-temperature chart. The temperatures at which these two sets of data exhibit a

common toughness value equal to or greater than the applicable over $2\frac{1}{2}$ in. (64 mm) thickness requirements of Table WB-2331.2-2 or Table WB-2331.2-1 shall be determined. The determined temperature for the unaffected base material shall be subtracted from the similarly determined temperature for the heat affected zone. The difference, if a positive number, shall be used in (b)(5) above as the adjustment temperature. The adjustment temperature shall be added to the highest T_{NDT} established by the tests of WB-2331.1 for all of the base material to be welded by this procedure in production. If the temperature difference is zero or a negative number, no adjustment is required for the base material to be welded in production, and the minimum temperature established by the tests for WB-2331.1 will still apply as stated in (b)(4) above.

Where the actual T_{NDT} is not required for the product material to be welded, for example, where a testing temperature is established by the Design Specification to determine that T_{NDT} is at or below the specified temperature, the adjustment temperature determined by the curves shall be used to establish a reduction in the specified testing temperature for the production material. The adjustment temperature shall be used to lower the specified testing temperature for any production material upon which the procedure will be used.

(c) Should the unaffected base material Charpy V-notch impact test results fail to meet the applicable requirements referenced in (b)(1) or (b)(4) above, additional unaffected base material Charpy V-notch impact tests shall be tested at higher temperatures until the applicable requirements are met. Charpy V-notch impact specimens of the heat affected zone shall be tested at the same temperature at which acceptable unaffected base material properties were achieved. The rules governing the average lateral expansion of the heat affected zone relative to the average lateral expansion of the unaffected base material shall be followed as in (b)(1) through (b)(3) or (b)(4) through (b)(6) above, as applicable, to determine the data which are to be recorded on the Welding Procedure Qualification Record.

Page 157

(d) A Welding Procedure Specification qualified to the impact testing requirements of Subsection NB or NE may be accepted as an alternative to the Welding Procedure impact testing requirements of this Division.

WB-4336 Qualification Requirements for Built-Up Weld Deposits

Built-up weld deposits for base metal reinforcement shall be qualified in accordance with the requirements of WB-4331 through WB-4335.

WB-4360 QUALIFICATION REQUIREMENTS FOR WELDING SPECIALLY DESIGNED WELDED SEALS

WB-4361 General Requirements

(a) Specially designed welded seals are defined as the walls or membranes, such as an omega shaped seal membrane, which confine the fluid and where strength is provided by a separate device.

(b) The welding procedure shall be qualified as a new procedure specification and shall be completely requalified when any of the essential variables specified or listed in the following paragraphs are made in the procedure. Changes other than those so given may be made in the procedure without the necessity for requalification provided the procedure is amended to show these changes. In addition, the essential variables specified in Section IX shall apply for both procedure and performance qualification.

WB-4362 Essential Variables for Automatic, Machine, and Semiautomatic Welding

The welding procedure shall be qualified as a new procedure specification and shall be completely requalified when any of the changes listed in this paragraph or the applicable portions of Section IX are made:

(a) when preplaced filler metal is melted to form all or part of a weld, a change from one alloy type or classification to any other alloy type or classification of base material or filler metal, even though previously qualified base materials and filler metals are of the same P-Number or A-Number;

(b) a change of any dimension of the weld joint for automatic or machine welding or a change of any dimension of the weld joint by more than 10% for semiautomatic welding beyond that qualified;

- (c) a change in the nominal size or shape of any filler metal added to the arc;
- (d) for automatic welding, an increase or decrease in the length of the seal weld by more than 30%;
- (e) for automatic welding, a change in the welding current greater than 50% of the difference between the maximum and minimum amperages used during qualification; only two test assemblies need to be welded for requalification;
- (f) any change in the angular relationship or distance between the welding electrode and the work and the filler metal beyond the range qualified;
- (g) the addition or deletion of the use of tack welds or locating fixtures to facilitate alignment or to maintain the root opening of the weld joint;
- (h) the addition or deletion of consumable inserts.

WB-4363 Essential Variables for Manual Welding

The welding procedure must be qualified as a new procedure specification and shall be completely requalified when any of the changes listed in (a) and (b) below are made in the procedure:

- (a) a change of more than $\pm 10\%$ of any dimension of the weld joint cross section other than the included angle of the groove, except that base material thickness may vary from minus 10% to 2.5 times the thickness qualified when welding parts of the same material thickness, or the thin member may vary from minus 10% to 2 times the thickness qualified when welding a thin seal membrane to a thick member;
- (b) when preplaced filler metal is melted to form all or part of a weld, a change from one alloy type or classification to any other alloy type or classification of base material or filler metal, even though previously qualified base materials and filler metals are of the same P-Number or A-Number.

WB-4366 Test Assembly

The test assembly shall consist of a duplicate of the production weld except that tolerances as stated in WB-4362(b) or WB-4363(a) are permitted. Except for automatic welding, the Certificate Holder may use a 12 in. (305 mm) length to qualify, if the length of the production weld is considered to be greater than necessary to qualify.

WB-4366.1 Automatic Welding.

For automatic welding, at least six consecutive test assemblies representing the range of dimensions to be qualified shall be required to establish the reproducibility of the welding procedure. In addition, the Certificate Holder making the production welds shall verify this capability of

Page 158

making two consecutive test assemblies prior to production welding using the previously qualified procedure.

WB-4366.2 Manual, Machine, and Semiautomatic Welding.

For manual, machine, and semiautomatic welding, two test assemblies shall be required.

WB-4367 Examination of Test Assembly

- (a) Where 100% weld penetration is required, the test assembly shall be sectioned, if necessary, to permit examination of the entire underside weld surface.
- (b) A minimum of four cross sections shall be taken from each test assembly. One cross section shall be made in a weld start and stop area and the others shall be taken at random. Each cross section shall be examined at $\times 10$ to $\times 15$ magnification in accordance with ASTM Standard E 2. All surfaces shall be free of cracks, incomplete penetration, incomplete melting of insert on consumable type welds, and porosity or inclusions in excess of one rounded void with the maximum dimension not greater than 10% of the thickness of the weld. When doubt exists as to the acceptability of the weld, after examination of four cross sections, the Inspector may require that additional metallographic cross sections be prepared for examination of the weld and adjacent base material.

WB-4368 Performance Qualification Test

The performance qualification test assembly shall meet the same requirements specified for the procedure qualification test assembly in WB-4366 and shall be examined in accordance with WB-4367. Furthermore, welding operators shall qualify using the welding machine which will be used to make production welds and shall be required to set up the machine with regard to adjustments and settings which affect the welding characteristics. One test assembly is required.

WB-4400 RULES GOVERNING MAKING, EXAMINING, AND REPAIRING WELDS

WB-4410 PRECAUTIONS TO BE TAKEN BEFORE WELDING

WB-4411 Identification, Storage, and Handling of Welding Material

Each Certificate Holder is responsible for control of the welding electrodes and other material which is used in the fabrication and installation of components (WB-4120). Suitable identification, storage, and handling of electrodes, flux, and other welding material shall be maintained. Precautions shall be taken to minimize absorption of moisture by electrodes and flux.

WB-4412 Cleanliness and Protection of Welding Surfaces

The method used to prepare the base metal shall leave the weld preparation with reasonably smooth surfaces. The surfaces for welding shall be free of scale, rust, oil, grease, and other deleterious material. The work shall be protected from deleterious contamination and from rain, snow, and wind during welding. Welding shall not be performed on wet surfaces.

WB-4420 RULES FOR MAKING WELDED JOINTS

WB-4421 Backing Rings

When used in components other than piping, backing rings shall conform to the requirements of WB-4240. Backing rings shall not be used in piping unless removed after welding and the inside surfaces of the roots are examined by a magnetic particle or liquid penetrant method, in accordance with WB-5110, and meeting the acceptance standards of WB-5340 or WB-5350. The material for backing rings, when used, shall be compatible with the base metal. Permanent backing rings, when permitted by WB-3352, shall be continuous, and any splices shall be made by full penetration welds. Spacer pins shall not be incorporated into the welds.

WB-4422 Peening

Controlled peening may be performed to minimize distortion. Peening shall not be used on the initial layer, root of the weld metal, or on the final layer unless the weld is postweld heat treated.

WB-4423 Miscellaneous Welding Requirements

(a) Before applying weld metal on the second side to be welded, the root of full penetration double welded joints shall be prepared by suitable methods, such as chipping, grinding, or thermal gouging, except for those processes of welding by which proper fusion and penetration are otherwise obtained and demonstrated to be satisfactory by welding procedure qualification.

(b) If the welding is stopped for any reason, extra care shall be taken in restarting to get the required

penetration and fusion. For submerged arc welding, chipping out a groove in the crater is recommended.

(c) Where single welded joints are used, particular care shall be taken in aligning and separating the components to be joined so that there will be complete penetration and fusion at the bottom of the joint for its full length.

WB-4424 Surfaces of Welds

As-welded surfaces are permitted, except for inertia and continuous drive friction welding where the flash shall be removed to sound metal. For piping, the appropriate stress indices given in Table WB-3681(a)-1 shall be applied. However, the surface of welds shall be sufficiently free from coarse ripples, grooves, overlaps, and abrupt ridges and valleys to meet (a) through (e) below.

(a) The surface condition of the finished weld shall be suitable for the proper interpretation of radiographic and other required nondestructive examinations of the weld. In those cases where there is a question regarding the surface condition of the weld on the interpretation of a radiographic film, the film shall be compared to the actual weld surface for interpretation and determination of acceptability.

(b) Reinforcements are permitted in accordance with WB-4426.1 for vessels, pumps, and valves, and WB-4426.2 for piping.

(c) Undercuts shall not exceed $\frac{1}{32}$ in. (0.8 mm) and shall not encroach on the required section thickness.

(d) Concavity on the root side of a single-welded circumferential butt weld is permitted when the resulting thickness of the weld meets the requirements of WB-3000.

(e) If the surface of the weld requires grinding to meet the above criteria, care shall be taken to avoid reducing the weld or base material below the required thickness.

WB-4425 Welding Items of Different Diameters

When items of different diameters are welded together, there shall be a gradual transition between the two surfaces in accordance with WB-4250, unless greater slopes are shown to be acceptable by analysis in accordance with WB-3200. The length of the transition may include the weld.

WB-4426 Reinforcement of Welds

WB-4426.1 Thickness of Weld Reinforcement for Containment Vessels and Valves.

The surface of the reinforcement of all butt welded joints in containment vessels and valves may be flush with the base material or may have uniform crowns. The height of reinforcement on each face of the weld shall not exceed the thickness in the following tabulation.

Nominal Thickness, in.	Maximum Reinforcement, in.
Up to 1, incl.	$\frac{3}{32}$
Over 1 to 2, incl.	$\frac{1}{8}$
Over 2 to 3, incl.	$\frac{5}{32}$
Over 3 to 4, incl.	$\frac{7}{32}$
Over 4 to 5, incl.	$\frac{1}{4}$
Over 5	$\frac{5}{16}$

WB-4427 Shape and Size of Fillet Welds

Fillet welds may vary from convex to concave. The shape and size of the weld shall be in accordance with the requirements of Fig. WB-4427-1. A fillet weld in any single continuous weld may be less than the specified fillet weld dimension by not more than $\frac{1}{16}$ in. (1.6 mm), provided that the total undersize portion of the weld does not exceed 10% of the length of the weld. Individual undersize weld portions shall not exceed 2 in. (51 mm) in length. In making socket welds, a gap as shown in Fig. WB-4427-1 shall be provided prior to welding. The gap need not be present nor be verified after welding.

WB-4428 Seal Welds of Threaded Joints

Where seal welding of threaded pipe joints is performed, the exposed threads shall be either removed entirely or covered

with weld metal.

WB-4429 Welding of Clad Parts¹

The joint types and welding procedures used for cladding shall be such as to prevent the formation of brittle weld composition.

¹ Welds that are exposed to corrosive action should have a resistance to corrosion that is not substantially less than that of the cladding. The use of filler metal that will deposit weld metal which is similar to the composition of the cladding material is recommended. If weld metal of different composition is used, it should have properties compatible with the application.

Page 160

Page 161

FIG. WB-4427-1 FILLET AND SOCKET WELD DETAILS AND DIMENSIONS
See WB-3661.2 for limitation on socket weld pipe size.

FIG. WB-4427-1 FILLET AND SOCKET WELD DETAILS AND DIMENSIONS

WB-4430 WELDING OF ATTACHMENTS

WB-4431 Materials for Attachments

Nonpressure-retaining attachments (WB-1132.1) welded to pressure retaining components shall be of materials which meet the requirements of WB-2121. Materials for pressure retaining attachments shall meet the requirements of WB-2120.

WB-4432 Welding of Structural Attachments

The rules of WB-4321 governing welding qualifications shall apply to the welding of structural attachments to pressure retaining material.

WB-4433 Structural Attachments

Structural attachments shall conform reasonably to the curvature of the surface to which they are to be attached and shall be attached by full penetration, fillet, or partial penetration continuous welds. When fillet and partial penetration welds are used on components, the requirements of WB-3123.2 shall be met. Attachments to the internal surfaces of containment vessels shall be made only with full penetration welds. Figure WB-4433-1 illustrates some of the typical details for attaching structural attachments to a component using full penetration welds. Valve seats may be attached to the pressure boundary part by fillet or partial penetration welds provided the valve seat is shouldered against the pressure boundary part.

WB-4434 Welding of Internal Structural Supports to Clad Components

Internal structural supports on clad components shall be welded to the base metal and not to the cladding, except for weld overlay cladding.

WB-4435 Welding of Nonstructural and Temporary Attachments and Their Removal

(a) Nonstructural attachments (WB-1132.1) welded to the pressure retaining portion of the component need not comply with WB-2000 and may be welded with continuous fillet or partial penetration welds, provided the requirements of (1) through (4) below are met.

- (1) The welding procedure and the welders have been qualified in accordance with WB-4321.
- (2) The material is identified and is compatible with the material to which it is attached.
- (3) The welding material is identified and compatible with the materials joined.
- (4) The welds are postweld heat treated when required by WB-4620.

(b) Removal of nonstructural attachments, when temporary, shall be accomplished as follows.

- (1) The immediate area around the temporary attachment is marked in a suitable manner so that after removal the area can be identified until after it has been examined in accordance with (3) below.
- (2) The temporary attachment is completely removed in accordance with the procedures of WB-4211.
- (3) After the temporary attachment has been removed, the marked area is examined by the liquid penetrant or magnetic particle method in accordance with the requirements of WB-5110, and meets the acceptance standards of WB-5340 or WB-5350, whichever is applicable.
- (4) As an alternative to (a)(4) above, postweld heat treatment may be deferred until after removal of the attachment.

WB-4436 Installation of Attachments to Piping Systems After Testing

Attachments may be welded to the piping system after performance of the pressure test provided that:

- (a) the welds do not require PWHT under WB-4622.7;
- (b) welds shall be restricted to fillet welds not exceeding $\frac{3}{8}$ in. (10 mm) throat thickness and to full penetration welds attaching materials not exceeding $\frac{1}{2}$ in. (13 mm) in thickness;
- (c) welds shall not exceed a total length of 24 in. (605 mm) for fillet welds or 12 in. (302 mm) for full penetration welds;
- (d) welds shall be examined as required by WB-5000.

WB-4450 REPAIR OF WELD METAL DEFECTS

WB-4451 General Requirements

Defects in weld metal detected by the examinations required by WB-5000, or by the tests of WB-6000, shall be eliminated and repaired when necessary.

WB-4452 Elimination of Surface Defects

Weld metal surface defects may be removed by grinding or machining, and need not be repaired by welding, provided that the requirements of (a) through (c) below are met.

Page 162

Page 163

FIG. WB-4433-1 TYPES OF ATTACHMENT WELDS

FIG. WB-4433-1 TYPES OF ATTACHMENT WELDS

- (a) The remaining thickness of the section is not reduced below that required by WB-3000.
- (b) The depression, after defect elimination, is blended uniformly into the surrounding surface.
- (c) The area is examined by a magnetic particle or liquid penetrant method in accordance with WB-5110 after blending and meets the acceptance standards of WB-5300 to ensure that the defect has been removed or reduced to an imperfection of acceptable limit. Defects detected by visual or volumetric method and located on an interior surface need only be reexamined by the method which initially detected the defect when the interior surface is inaccessible for surface examination.

WB-4453 Requirements for Making Repairs of Welds

Excavations in weld metal, when repaired by welding, shall meet the following requirements.

WB-4453.1 Defect Removal.

Defects may be removed by mechanical means or by thermal gouging processes. The area prepared for repair shall be examined by a liquid penetrant or magnetic particle method in accordance with WB-5110, and meet the acceptance standards of WB-5340 or WB-5350. This examination is not required where defect elimination removes the full thickness of the weld and where the backside of the weld joint is not accessible for removal of examination materials.

WB-4453.2 Requirements for Welding Material, Procedures, and Welders.

The weld repair shall be made using welding material, welders, and welding procedures qualified in accordance with WB-4125 and WB-4300.

WB-4453.3 Blending of Repaired Areas.

After repair, the surface shall be blended uniformly into the surrounding surface.

WB-4453.4 Examination of Repair Welds

(a) The examination of a weld repair shall be repeated as required for the original weld, except that when the defect was originally detected by the liquid penetrant or magnetic particle method, and when the repair cavity does not exceed the lesser of $\frac{3}{8}$ in. (10 mm) or 10% of the thickness, it need only be reexamined by the liquid penetrant or magnetic particle method.

(b) When repairs to welds joining P-No. 1 and P-No. 3 materials require examination by radiography as required in (a) above, but construction assembly prevents meaningful radiographic examination, ultrasonic examination may be substituted provided:

- (1) the weld had been previously radiographed and met the applicable acceptance standards;
- (2) the ultrasonic examination is performed using a procedure in accordance with Section V, Article 5, to the acceptance standards of WB-5330;
- (3) the substitution is limited to Category A and B welds in vessels, and similar type welds in other items.

The absence of suitable radiographic equipment is not justification for the substitution.

WB-4453.5 Heat Treatment of Repaired Areas.

The area shall be heat treated in accordance with WB-4620.

WB-4500 BRAZING

WB-4510 RULES FOR BRAZING

WB-4511 Where Brazing May Be Used

(a) Brazing is permitted for the attachment of cladding to base material, of tubes to tubesheets, and as specified in WB-3671.6(a). Appurtenances and piping with outside diameter equal to that of 1 in. nominal pipe size and less may be fabricated using brazed joints in accordance with Fig. WB-4511-1.

(b) Valves with inlet piping connections of 4 in. nominal pipe size and less may have seats brazed to the valve body or bonnet provided the seat is shouldered against the pressure boundary part [Fig. WB-3544.1(c)-1].

WB-4512 Brazing Material

Where brazing is permitted, the brazing filler material and fluxes shall conform to the rules covering identification in WB-2150 and to the requirements of (a), (b), and (c) below.

(a) The filler material used in brazing shall be a nonferrous metal or alloy with a solidus temperature above 800°F (427°C) and at least 500°F (278°C) above the highest temperature of the joint in service.

(b) The filler material shall melt and flow freely by capillary action within the desired temperature range, and, in conjunction with a suitable flux or controlled atmosphere, the filler material shall wet and adhere to the surfaces to be joined.

(c) Fluxes that are fluid and chemically active at the brazing temperature shall be used, when necessary, to prevent oxidation of the filler metal and the surfaces to be joined, and to promote free flowing of the filler material.

Page 164

Page 165

t = thickness of part penetrated
 t_n = nominal thickness of connecting part
 d = outside diameter of part B
 c = clearance or interference between mating parts and shall be in accordance with the brazing procedure specification
 Z = depth of engagement and shall be the lesser of $3t_n$ or d , but in no case less than $1/4$ in.

GENERAL NOTES:

- (a) Part A shall be attached to a component in accordance with the requirements for the component proper.
- (b) Part B shall be attached either to Part A or to another Part B by the joints shown above, or in accordance with the requirements of the component proper.
- (c) Grooves for preplaced filler metal are permitted, provided the reduction in cross section due to the grooves is considered in the design.

FIG. WB-4511-1 BRAZED CONNECTIONS FOR APPURTENANCES AND PIPING, 1 in. NOMINAL SIZE AND LESS

FIG. WB-4511-1 BRAZED CONNECTIONS FOR APPURTENANCES AND PIPING, 1 in. NOMINAL SIZE AND LESS

WB-4520 BRAZING QUALIFICATION REQUIREMENTS

WB-4521 Brazing Procedure and Performance Qualification

Qualification of the brazing procedure to be used and of the performance of brazers and brazing operators is required and shall comply with the requirements of Section IX, except that validation of the procedure qualification per QB-451.5 Note (1) is not required for the furnace brazing of seat rings to bodies or bonnets of valves having inlet piping connections of 4 in. (102 mm) nominal pipe size and less. When the Design Temperature is greater than 200°F (93°C), tension testing shall be performed at the Design Temperature.

WB-4522 Brazing Requalification Requirements

In addition to the requirements of Section IX, the brazing procedure shall be set up as a new procedure specification and shall be completely requalified when the construction of the brazed components includes reheating of any portion of the completed brazed joint to a temperature that is within 300°F (149°C) of the solidus temperature of the filler metal.

WB-4530 FITTING AND ALIGNING OF PARTS TO BE BRAZED

Parts to be joined by brazing shall be fitted, aligned, and retained in position during the brazing operation within the tolerances specified in the brazing procedure specification. Brazed joints shall be assembled in a sequence which will permit the maximum number of joints to be visually examined on both sides of the joint after brazing.

WB-4540 EXAMINATION OF BRAZED JOINTS

The completed brazed joints shall be visually examined on all accessible surfaces in accordance with WB-5275.

WB-4600 HEAT TREATMENT

WB-4610 WELDING PREHEAT REQUIREMENTS

WB-4611 When Preheat Is Necessary

The need for and temperature of preheat are dependent on a number of factors, such as the chemical analysis, degree of restraint of the parts being joined, elevated temperature, physical properties, and material thicknesses. Some practices used for preheating are given in Appendix D as a general guide for the materials listed by P-Numbers of Section IX. It is cautioned that the preheating suggested in Appendix D does not necessarily ensure satisfactory completion of the welded joint and that the preheating requirements for individual materials within the P-Number may be more or less restrictive. The Welding Procedure Specification for the material being welded shall specify the minimum preheating requirements under the welding procedure qualification requirements of Section IX.

WB-4612 Preheating Methods

Preheat for welding or thermal cutting, when employed, may be applied by any method which does not harm the base material or any weld metal already applied, or which does not introduce deleterious material into the welding area which is harmful to the weld.

WB-4613 Interpass Temperature

Consideration shall be given to the limitations of interpass temperatures for quenched and tempered material to avoid detrimental effects on the mechanical properties.

WB-4620 POSTWELD HEAT TREATMENT

WB-4621

WB-4621 Heating and Cooling Methods

Postweld heat treatment (PWHT) may be accomplished by any suitable methods of heating and cooling, provided the required heating and cooling rates, metal temperature, metal temperature uniformity, and temperature control are maintained.

Page 166

WB-4622 PWHT Time and Temperature Requirements

WB-4622.1 General Requirements.²

Except as otherwise permitted in WB-4622.7, all welds, including repair welds, shall be postweld heat treated. During postweld heat treatment, the metal temperature shall be maintained within the temperature range and for the minimum holding time specified in Table WB-4622.1-1, except as otherwise permitted in WB-4622.4(c). P-Number groups in Table WB-4622.1-1 are in accordance with QW-420 of Section IX. Except as provided in WB-4624.3, PWHT shall be performed in temperature-surveyed and -calibrated furnaces, or PWHT shall be performed with thermocouples in contact with the material or attached to blocks in contact with the material. In addition, the requirements of the following subparagraphs shall apply.

WB-4622.2 Time-Temperature Recordings.

Time-temperature recordings of all postweld heat treatments shall be made available for review by the Inspector. Identification on the time-temperature recording shall be to the weld, part, or component, as applicable. A summary of the time-temperature recording may be provided for permanent records in accordance with WA-4134.17.

WB-4622.3 Definition of Nominal Thickness Governing PWHT.

Nominal thickness in Table WB-4622.7(b)-1 is the thickness of the weld, the pressure retaining material for structural attachment welds or the thinner of the pressure retaining materials being joined, whichever is least. It is not intended that nominal thickness include material provided for forming allowance, thinning, or mill overrun when the excess material does not exceed $\frac{1}{8}$ in. (3.2 mm). For fillet welds the nominal thickness is the throat thickness, and for partial penetration and material repair welds the nominal thickness is the depth of the weld groove or preparation.

WB-4622.4 Holding Times at Temperature

(a) The holding time at temperature as specified in Table WB-4622.1-1 shall be based on the nominal thickness of the weld. The holding time need not be continuous. It may be an accumulation of the times of multiple postweld heat treat cycles.

2 Any postweld heat treatment time which is anticipated to be applied to the material or item after it is completed shall be specified in the Design Specification. The Certificate Holder shall include this time in the total time at temperature specified to be applied to the test specimens.

(b) Holding time at temperature in excess of the minimum requirements of Table WB-4622.1-1 may be used, provided that specimens so heat treated are tested in accordance with WB-2200, WB-2400, and WB-4300.

(c) Alternatively, when it is impractical to postweld heat treat at the temperature range specified in Table WB-4622.1-1, it is permissible to perform the postweld heat treatment of certain materials at lower temperatures for longer periods of time in accordance with Table WB-4622.4(c)-1 and (1), (2), and (3) below.

(1) Except for P-No. 1 materials, when welds in the materials listed in Table WB-4622.4(c)-1 are to be postweld heat treated at the lower minimum temperatures, the impact test specimens for the welding procedure qualification required by WB-4300 shall be made using the same minimum temperatures and increased minimum holding time. Welding procedures, qualified at the temperature range and minimum holding time specified in Table WB-4622.1-1 and at the lower temperature and increased minimum holding time permitted by Table WB-4622.4(c)-1, are also qualified for any temperature in between. When such an in-between temperature is used, the minimum holding time shall be interpolated from Table WB-4622.1-1 and the alternative requirements from Table WB-4622.4(c)-1.

(2) Except for P-No. 1 materials, when welds in the materials listed in Table WB-4622.4(c)-1 are to be postweld heat treated at these lower minimum temperatures, the welding material certification required by WB-2400 shall be made

using the same minimum temperature and increased minimum holding time. Welding material certified at the temperature range and minimum holding time specified in Table WB-4622.1-1 and at the lower minimum temperatures and increased minimum holding time permitted by Table WB-4622.4(c)-1 are also certified for any temperature in between.

(3) Base material certified in accordance with WB-2200 may be postweld heat treated at the lower minimum temperature ranges and increased minimum holding times without recertification. Postweld heat treatment at these lower minimum temperatures and increased minimum holding times may also be the tempering operation provided a higher tempering temperature is not required by the material specification.

WB-4622.5 PWHT Requirements When Different P-Number Materials Are Joined.

When materials of two different P-Number groups are joined by welding, the applicable postweld heat treatment shall be that specified in Table WB-4622.1-1 for the material requiring the higher PWHT temperature range.

WB-4622.6 PWHT Requirements for Nonpressure-Retaining Parts.

When nonpressure-retaining material is welded to pressure retaining material, the postweld

Page 167

heat treatment temperature range of the pressure retaining material shall control.

TABLE WB-4622.1-1
MANDATORY REQUIREMENTS FOR POSTWELD HEAT TREATMENT OF WELDS [Note (1)]

P-No. (QW-420, Sect. IX)	Holding Temperature Range, °F [Note (2)]	Minimum Holding Time at Temperature for Weld Thickness (Nominal)			
		½ in. or less	Over ½ in. to 2 in.	Over 2 in. to 5 in.	Over 5 in.
1, 3	1100–1250	30 min	1 hr/in.	2 hr plus 15 min each additional inch over 2 in.	2 hr plus 15 min each additional inch over 2 in.
4	1100–1250	30 min	1 hr/in.	1 hr/in.	5 hr plus 15 min each additional inch over 5 in.
5A, 5B, 5C, 6 except P-No. 6 Gr. 4	1250–1400	30 min	1 hr/in.	1 hr/in.	5 hr plus 15 min each additional inch over 5 in.
6 Gr. 4	1050–1150				
7	1300–1400	30 min	1 hr/in.	1 hr/in.	5 hr plus 15 min each additional inch over 5 in.
9A Gr. 1	1100–1250	30 min	1 hr/in.	1 hr/in.	5 hr plus 15 min each additional inch over 5 in.
9B Gr. 1	1100–1175				
10F Gr. 1	1100–1250				
10I Gr. 1	1300–1400				
11A Gr. 4	1000–1050	30 min	1 hr/in.	1 hr/in.	1 hr/in.
P-Nos. 8, 34, 42, 43, 45, and hard surfacing on P-No. 1 base metal whose reported carbon content is not more than 0.30%	PWHT neither required nor prohibited				

NOTES:

- (1) Exemptions to the mandatory requirements of this Table are defined in NB-4622.7.
(2) All temperatures are metal temperatures.

TABLE WB-4622.1-1 MANDATORY REQUIREMENTS FOR POSTWELD HEAT TREATMENT OF WELDS
[Note (1)]

**TABLE WB-4622.4(c)-1
ALTERNATIVE HOLDING TEMPERATURES AND
TIMES [Note (1)]**

Material P-No.	Alternative Minimum Holding Temperatures, °F	Alternative Minimum Holding Times [Note (1)]
1, 3, 9A Gr. 1, 9B Gr. 1	1050	2 hr/in. thick
1, 3, 9A Gr. 1, 9B Gr. 1	1000	4 hr/in. thick

NOTE:

(1) All other requirements of NB-4622 shall apply.

TABLE WB-4622.4(c)-1 ALTERNATIVE HOLDING TEMPERATURES AND TIMES [Note (1)]

WB-4622.7 Exemptions to Mandatory Requirements.

Postweld heat treatment in accordance with this Subarticle is not required for:

- (a) nonferrous material;
- (b) welds exempted in Table WB-4622.7(b)-1;
- (c) welds subjected to temperatures above the PWHT temperature range specified in Table WB-4622.1-1, provided the Welding Procedure Specification is qualified in accordance with Section IX and the base material and the deposited weld filler material have been heat treated at the higher temperature;
- (d) welds connecting nozzles to components or branch to run piping provided the requirements in WB-4622.8 are met;
- (e) weld repairs to vessels provided the requirements of WB-4622.9 are met;
- (f) weld repairs to cladding after final postweld heat treatment provided the requirements of WB-4622.10 are met;
- (g) weld repairs to dissimilar metal welds after final postweld heat treatment provided the requirements of WB-4622.11 are met.

WB-4622.8 Requirements for Exempting PWHT of Nozzles to Component Welds and Branch to Run Piping Welds.

Welds connecting nozzles or branch piping of P-No. 1 materials to components or run piping of P-No. 1 or P-No. 3 materials that are not exempted from PWHT in Table WB-4622.7(b)-1 need not be given a postweld heat treatment if the requirements of (a) below are met for partial penetration and (b) below are met for full penetration welds.

(a) The partial penetration welds are made with A-No. 8 or non-air-hardening nickel-chromium-iron weld metal after:

(1) the ferritic materials to be joined are buttered or built-up with A-No. 8 or non-air-hardening nickel-chromium-iron weld metal having a minimum thickness of $\frac{1}{4}$ in. (6 mm), and

(2) the heat affected zones of the buttered or built-up ferritic materials are postweld heat treated in accordance with WB-4620, without the PWHT exemptions being applied, prior to making the final welds.

(b) The full penetration welds are made with A-No. 1 or A-No. 2 weld metal provided that:

(1) the component or run pipe is built-up or buttered in the area of the attachment with A-No. 1 or A-No. 2 metal having a minimum thickness of $\frac{1}{4}$ in. (6 mm);

(2) the A-No. 1 or A-No. 2 weld metal buildup or buttering is postweld heat treated in accordance with WB-4620 for P-No. 1 or P-No. 3 materials without the PWHT exemptions being applied;

(3) the welds do not penetrate through the component or run pipe thickness;

(4) weld metal with A-No. 1 or A-No. 2 analysis is used to join the nozzle or branch pipe of P-No. 1 material to the weld buildup or buttering;

(5) the nominal thickness of the weld joining the nozzle or branch pipe to the component or run pipe does not exceed $1\frac{1}{2}$ in. (38 mm) and the maximum reported carbon content of the nozzle or branch piping connection does not exceed 0.30%;

(6) a 200°F (93°C) minimum preheat is maintained during welding whenever the nominal thickness of the weld exceeds:

(a) $1\frac{1}{4}$ in. (32 mm) and the maximum reported carbon content of the material of the nozzle or branch pipe is 0.30% or less, or

(b) $\frac{3}{4}$ in. (19 mm) and the maximum reported carbon content of material of the nozzle or branch pipe connection exceeds 0.30%.

WB-4622.9 Temper Bead Weld Repair.

Limited weld repairs to P-No. 1 and P-No. 3 material, and A-Nos. 1, 2, 10, or 11 weld filler metal (QW-442 of Section IX), may be made without PWHT or after the final PWHT, provided it is impossible or impractical to postweld heat treat the area after repair, and provided the requirements of the following subparagraphs are met.

(a) *Examination of Area to Be Repaired.* Before repair, the area shall be examined by either the magnetic particle or liquid penetrant method in accordance with WB-5000.

(b) *Maximum Extent of Repair.* The maximum area of an individual repair based on the finished surface shall be 100 sq in. (3,871 mm²) and the depth of repair

Page 169

shall not be greater than one-third of the base material thickness. Pages 170-171

TABLE WB-4622.7(b)-1 (CONT'D) EXEMPTIONS TO MANDATORY PWHT [Note (1)]

TABLE WB-4622.7(b)-1 (CONT'D)

NOTES:

- (1) The exemptions noted in this Table do not apply to the following:
 - (a) electron beam welds in ferritic materials over $\frac{1}{8}$ in. in thickness;
 - (b) inertia and friction welds in material of any thickness of P-No. 3, P-No. 4, P-No. 5, P-No. 7 (except for Types 405 and 410S), P-No. 10, and P-No. 11 materials.
- (2) Where the thickness of material is identified in the Type of Weld column, it is the thickness of the base material at the welded joint.
- (3) Carbon level of the pressure-retaining materials being joined.
- (4) Maximum process heat input = 150,000 J/in. The maximum resulting hardness in the procedure qualification test plate shall not exceed 35 Rc.
- (5) Intermediate postweld soak at not less than 200°F for 2 hr minimum.
- (6) Intermediate postweld soak at not less than 300°F for 2 hr minimum.

TABLE WB-4622.7(b)-1 (CONT'D)

(c) *Repair Welding Procedure.* The welding procedure shall be in accordance with Section IX and this Division and shall include the requirements of (1) through (6) below.

- (1) The area to be repaired shall be suitably prepared for welding in accordance with a written procedure.
- (2) The weld metal shall be deposited by the manual shielded metal arc process using low hydrogen type electrode. The maximum bead width shall be four times the electrode core diameter.
- (3) The low hydrogen covered electrodes shall be baked and otherwise cared for as required by (a) through (d) below.

(a) The Certificate Holder shall bake all covered electrodes before use at a temperature of 750°F-850°F (399°C-454°C) for 30 min to 1 hr. The temperature of the oven shall not exceed 300°F (149°C) when the electrodes are placed in the oven for baking. During the baking cycle, the temperature shall not be raised more than 300°F/hr (167°C/hr) when oven temperatures are above 500°F (260°C) and the total time above 500°F (260°C), including the holding time, shall not exceed 5 hr.

(b) After baking and before the electrodes are allowed to cool below 225°F (107°C), they shall be transferred to holding ovens operating in temperature ranges of 225°F-350°F (107°C-177°C).

(c) Suitable heated portable containers shall be used at 225°F-350°F (107°C-177°C). Electrodes turned in after exposure shall be returned to the holding ovens and held at temperatures given in (b) above for a period of not less than 8 hr before reissue.

(d) Electrodes shall not be rebaked more than once, except if tests establish that the electrodes, after multiple rebakings, meet all specification requirements.

(e) If the repair area is to be subjected to a significant fast neutron fluence (greater than 10^{19} nvt $E_0 > 1$ MeV), electrode shall be limited to Cu content of 0.10% maximum (as deposited).

(4) The weld area plus a band around the repair area of at least $1\frac{1}{2}$ times the component thickness or 5 in. (127 mm), whichever is less, shall be preheated and maintained at a minimum temperature of 350°F (177°C) during welding. The maximum interpass temperature shall be 450°F (232°C). Thermocouples and recording instruments shall be used to monitor the process temperatures. Their removal shall be in accordance with WB-4435(b).

(5) The cavity shall be buttered, using a $\frac{3}{32}$ in. (2.4 mm) diameter electrode as shown in Fig. WB-4622.9(c)(5)-1. The weld bead crown surface shall be removed by grinding or machining before depositing the second layer [see Fig. WB-4622.9(c)(5)-1, Step 2]. The second layer shall be deposited with a $\frac{1}{8}$ in. (3.2 mm) diameter electrode. Subsequent layers shall be deposited with a welding electrode no larger than $\frac{5}{32}$ in. (4 mm) diameter. Bead deposition shall be performed in a manner shown in Fig. WB-4622.9(c)(5)-1, Step 3. The completed weld shall have at least one layer of weld reinforcement deposited and then this reinforcement shall be removed by mechanical means, making the finished surface of the repair substantially flush with the surface of the vessel surrounding the repair [Fig. WB-4622.9(c)(5)-2].

The technique described in this paragraph shall be performed in the procedure qualification test.

(6) The weld area shall be maintained at a temperature of 450°F-550°F (232°C-288°C) for a minimum period of 2 hr after completion of the weld repair in P-No. 1 materials. For P-No. 3 materials, the holding time shall be a minimum of 4 hr.

(d) Examination of Repair Welds. The second (temper bead) layer shall be examined by the magnetic particle

Page 172

or liquid penetrant method. The completed weld shall have the weld reinforcement, including the final layer, removed substantially flush with the surface prior to performing the required nondestructive examination. The nondestructive examination shall be performed after the completed weld has been at ambient temperature for a minimum period of 48 hr to detect the presence of possible delayed cracking of the weldment. The nondestructive examination of the repair welded and preheated region shall be in accordance with WB-4453.4. In addition, all repairs shall be ultrasonically examined. All nondestructive examination shall be in accordance with WB-5000.

(e) Documentation of Weld Repairs. Documentation of weld repairs shall be in accordance with WB-4130, exclusive of the size requirements.

(f) Welding Procedure Qualification Test Plate. The test assembly materials for the welding procedure qualification shall be of the same P-Number and Group Number, including a postweld heat treatment that is at least equivalent to the time and temperature applied to the materials being repaired. The depth of cavity in the test assembly shall be a minimum of one-half the depth of actual repair, but not less than 1 in. (25 mm). The test assembly thickness shall be a minimum of twice the depth of cavity in the test assembly. The test assembly shall be large enough to permit removal of the required test specimens. In order to simulate the restraint that the weld metal will experience in the repair section of the component, the test assembly dimensions surrounding the cavity shall be equal to the test assembly thickness, but not less than 6 in. (152 mm). The qualification test plate shall be prepared in accordance with Fig. WB-4622.9(f)-1.

(g) This test assembly may be used to qualify procedures for weld buildup repairs of pressure retaining materials. In this case, the depth of the cavity shall not be less than the thickness of the weld buildup or 1 in. (25 mm), whichever is greater, and the area of the weld buildup to be applied or 54 sq in. (34,839 mm²), whichever is less.

(h) In all cases, the test assembly and cavity shall be of sufficient size to permit removal of the required test specimens.

(i) Performance Qualifications. If the repair weld is to be performed where physical obstructions impair the welder's ability to perform, the welder shall also demonstrate the ability to deposit sound weld metal in the positions required, using the same parameters and simulated physical obstructions as are involved in the repair.

WB-4622.10 Repair Welds to Cladding After Final Postweld Heat Treatment.

Nonpostweld heat treated weld repairs may be made to P-No. 8 or P-No. 43 cladding of P-No. 1 and P-No. 3 material after final PWHT, provided it is impossible or impractical to postweld heat treat the area after repair, and provided the requirements of the following subparagraphs are met.

(a) Maximum Extent of Repair. This procedure may be used with the base material exposed to a depth not greater than ¹/₄ in. (6 mm) or 10% of the base material thickness, whichever is less, nor to an individual area greater than 100 sq in. Areas with greater base material exposure depth shall be repaired in accordance with WB-4622.9 to within this limit before implementing the cladding repair.

(b) Repair Welding Procedure. The welding procedure shall be in accordance with Section IX and this Division, and shall include the requirements of (1) through (7) below.

(1) The repairs shall be made using A-No. 8 weld metal (Section IX, QW-442) for P-No. 8 cladding or F-No. 43 weld metal (Section IX, QW-432) for either P-No. 8 or P-No. 43 cladding.

(2) The manual shielded metal arc process shall be used for welding with a bead width not to exceed four times the electrode core diameter.

(3) All covered electrodes used for qualification test and repair welding shall be from unopened, hermetically sealed packages or heated ovens maintained between 225°F (107°C) and 350°F (177°C). Electrodes withdrawn from

hermetically sealed containers or ovens for longer than 8 hr shall be discarded.

(4) During the repair, the electrodes may be maintained in heated ovens in the repair area. The oven temperature shall be maintained between 225°F (107°C) and 350°F (177°C). Electrodes exposed to the atmosphere for more than 8 hr shall be discarded.

(5) The weld area plus a band around the clad repair of $1\frac{1}{2}$ times the component thickness or 5 in. (127 mm), whichever is less, shall be preheated and maintained at a minimum temperature of 350°F (177°C) during welding. The maximum interpass temperature shall be 450°F (232°C). Thermocouples and recording instruments shall be used to monitor the process temperatures. Their removal shall be in accordance with WB-4435.

(6) All areas of the base material on which weld metal is to be deposited shall be covered with a single layer of weld deposit using $\frac{3}{32}$ in. (2.4 mm) diameter electrode, followed by a minimum of one layer of weld deposit using $\frac{1}{8}$ in. (3.2 mm) diameter electrode. Subsequent layers may be deposited with electrode no

Page 173

larger than $\frac{5}{32}$ in. (4 mm). The weld bead crown surface of the first layer shall be removed by grinding.

Step 1: Butter cavity with one layer of weld metal using $\frac{3}{32}$ in. diameter coated electrode.

Step 2: Remove the weld bead crown of the first layer of grinding.

Step: The second layer shall be deposited with a $\frac{1}{8}$ in. diameter electrode. Subsequent layers shall be deposited with welding electrodes no larger than $\frac{5}{32}$ in. maximum diameter. Bead deposition shall be performed in a manner as shown. Particular care shall be taken in the application of the temper bead reinforcement weld at the tie-in points as well as its removal to ensure that the heat affected zone of the base metal and the deposited weld metal is tempered and the resulting surface is substantially flush.

FIG. WB-4622.9(c)(5)-1 TEMPER BEAD WELD REPAIR AND WELD TEMPER BEAD REINFORCEMENT

FIG. WB-4622.9(c)(5)-1 TEMPER BEAD WELD REPAIR AND WELD TEMPER BEAD REINFORCEMENT

NOTE:

- (1) Apply temper bead reinforcement weld metal to a level above the surface and then remove it substantially flush to the surface as required by NB-4622.9(c)(5).**

**FIG. WB-4622.9(c)(5)-2 TEMPER
BEAD
REINFORCEMENT**

FIG. WB-4622.9(c)(5)-2 TEMPER BEAD REINFORCEMENT

(7) After completion of welding, the weld area shall be maintained at a temperature of 450°F-550°F (232°C-288°C) for a period of 2 hr for P-No. 1 material and 4 hr for P-No. 3 material.

(c) *Examination of Repair Welds.* The weld repair as well as the preheated band shall be examined by the liquid penetrant method. All nondestructive examination shall be in accordance with WB-5000.

(d) *Documentation of Weld Repairs.* Documentation of weld repairs shall be in accordance with WB-4130, exclusive of the size requirements.

(e) *Welding Procedure Qualification Test Plate*

(1) The test assembly material for the welding procedure qualification test shall be of the same P-Number and Group Number, including a postweld heat treatment that is at least equivalent to the time and temperature of that applied to the material being repaired. If the repair involves two different P-Number or Group Number materials, the test assembly shall duplicate the combination.

(2) The test assembly base material shall be at least 12 in. (305 mm) by 12 in. (305 mm), 2 in. (51 mm) min. thickness, with a clad surface area of at least 8 in. (203 mm) by 8 in. (203 mm), in the area from which the bend test specimens will be removed.

(3) The qualification test plate assembly shall be prepared and tested in accordance with the requirements of Section IX. The guided bend test acceptance standards described in Section IX for cladding shall also be applicable to the HAZ of the base material.

(f) *Performance Qualifications.* If the repair weld is to be performed where physical obstructions impair the welder's ability to perform, the welder shall also demonstrate the ability to deposit sound weld metal in the positions required, using the same parameters and simulated physical obstructions as are involved in the repair.

WB-4622.11 Temper Bead Weld Repair to Dissimilar Metal Welds or Buttering.

Whenever PWHT is impractical or impossible, limited weld repairs to dissimilar metal welds of P-No. 1 and P-No. 3 material or weld filler metal A-No. 8 (Section IX, QW-442) or F-No. 43 (Section IX, QW-432) may be made without PWHT or after the final PWHT provided the requirements of the following subparagraphs are met.

(a) *Examination of Area to Be Repaired.* Before repair, the area shall be examined by either the magnetic particle or liquid penetrant method in accordance with WB-5000.

(b) *Maximum Extent of Repair.* Repairs made to this paragraph are limited to those along the fusion line of a nonferritic weld to ferritic base material where $\frac{1}{8}$ in. (3.2 mm) or less of nonferritic weld deposit exists above the original fusion line after defect removal. If the defect penetrates into the ferritic base material, repair of the base material may be performed in accordance with WB-4622.11 provided the depth of repair in the base material does not exceed $\frac{3}{8}$ in. (10 mm). The repairs to a completed joint shall not exceed one-half the joint thickness. The surface of the completed repair shall not exceed 100 sq in. (65,000 mm²).

(c) *Repair Welding Procedure.* The welding procedure and welder qualification shall meet all of the requirements of Section IX and the additional requirements of this Article. In addition, the Welding Procedure Specification shall include the following requirements.

(1) The area to be repaired shall be suitably prepared for welding in accordance with the written procedure to be used for the repair.

(2) The weld metal shall be deposited by the shielded metal arc welding process (SMAW) using A-No. 8 weld metal (Section IX, QW-442) for P-No. 8 to P-No. 1 or P-No. 3 weld joints or F-No. 43 weld metal (Section IX, QW-432) for either P-No. 8 or P-No. 43 to P-No. 1 or P-No. 3 weld joints. The maximum bead width shall be four times the electrode core diameter.

(3) All covered electrodes used for qualification test and repair welding shall be from unopened, hermetically sealed packages or heated ovens maintained between 225°F (107°C) and 350°F (177°C). Electrodes withdrawn from hermetically sealed containers or ovens for longer than 8 hr shall be discarded.

(4) During the repair, the electrode may be maintained in heated ovens in the repair area. The oven

Page 175

temperature shall be maintained between 225°F (107°C) and 350°F (177°C). Electrodes exposed to the atmosphere for more than 8 hr shall be discarded.

monitor the metal temperature during welding. Their removal shall be in accordance with WB-4435.

(6) All areas of the ferritic base material, exposed or not, on which weld metal is to be deposited, shall be covered with a single layer of weld deposit using $\frac{3}{32}$ in. (2.4 mm) diameter electrode. The weld bead crown surface shall be removed by grinding before depositing the second layer. The second layer shall be deposited with $\frac{1}{8}$ in. (3.2 mm) diameter electrode. Subsequent layers may be deposited with $\frac{5}{32}$ in. (4 mm) maximum diameter electrode. The techniques described in this paragraph shall be duplicated in the procedure qualification. [See Fig. WB-4622.11(c)(6)-1].

(7) After at least $\frac{3}{16}$ in. (4.8 mm) of weld metal has been deposited, the preheated area as defined in (c)(5) above shall be maintained in the range of 450°F-550°F (232°C-288°C) for 4 hr as a minimum.

(8) Subsequent to the above heat treatment, the balance of the welding may be performed at a minimum preheat temperature of 100°F (38°C) and at a maximum interpass temperature of 350°F (177°C).

(d) Examination of Repair Areas

(1) After the heat treatment specified in (c)(7) above has been completed, the repaired area shall be examined by the liquid penetrant method.

(2) The repaired area and the preheated band as defined in (c)(5) above shall be examined by the liquid penetrant method after the completed weld has been at ambient temperature for a minimum of 48 hr. The repaired region shall be examined by the radiographic method and, if practical, by the ultrasonic method.

(3) For repairs to partial penetration welds, the radiographic and ultrasonic examinations specified in (d)(2) above need not be performed, if meaningful results cannot be obtained. For these cases, liquid penetrant examination only shall be performed. For weld repair depths approximately $\frac{3}{16}$ in. (4.8 mm), liquid penetrant examination shall be performed at the time specified in (d)(2) above. For weld repair depths greater than $\frac{3}{16}$ in. (4.8 mm), liquid penetrant examination shall be performed after approximately $\frac{3}{16}$ in. (4.8 mm) thickness has been deposited and the post heat specified in (c)(7) above has been completed. Additional incremental deposit thicknesses shall be liquid penetrant examined in accordance with WB-5245. The final weld surface shall be liquid penetrant examined at the time specified in (d)(2) above.

(4) All nondestructive examination shall be in accordance with WB-5000.

(e) Documentation of Weld Repairs. Documentation of weld repairs shall be in accordance with WB-4130, exclusive of the size requirements.

(f) Welding Procedure Qualification Test Plate. The test assembly materials for the welding procedure qualification shall be of the same P-Number and Group Number, including a postweld heat treatment that is at least equivalent to the time and temperature applied to the materials being repaired. The depth of cavity in the test assembly shall be a minimum of one-half the depth of actual repair but not less than 1 in. (25 mm). The test assembly thickness shall be a minimum of twice the depth of cavity in the test assembly. The test assembly shall be large enough to permit removal of the required test specimens. In order to simulate the restraint that the weld metal will experience in the repaired section of the component, the test assembly dimensions surrounding the cavity shall be equal to the test assembly thickness, but not less than 6 in. The qualification test plate shall be prepared in accordance with Fig. WB-4622.9(f)-1.

(g) Performance Qualifications. If the repair weld is to be performed where physical constructions impair the welder's ability to perform, the welder shall also demonstrate the ability to deposit sound weld metal in the positions required, using the same parameters and simulated physical obstructions as are involved in the repair.

WB-4623 PWHT Heating and Cooling Rate Requirements

Above 800°F the rate of heating and cooling in any hourly interval shall not exceed 400°F divided by the maximum thickness in inches of the material being heat treated, but shall not exceed 400°F and need not be less than 100°F in any hourly interval. During the heating and cooling period there shall not be a greater variation in temperature than 250°F within any 15 ft interval of weld length. The exceptions of (a) and (b) below are permitted.

(a) P-No. 6 material may be cooled in air from the postweld heat treatment holding temperature specified in Table

(b) For P-No. 7 material the cooling rate at temperatures above 1200°F shall not exceed 100°F/hr, after

which the rate of cooling shall be sufficiently rapid to prevent embrittlement.

FIG. WB-4622.11(c)(6)-1 TEMPER BEAD WELD REPAIR AND WELD TEMPER BEAD REINFORCEMENT OF DISSIMILAR METAL WELDS OR BUTTERING

FIG. WB-4622.11(c)(6)-1 TEMPER BEAD WELD REPAIR AND WELD TEMPER BEAD REINFORCEMENT OF DISSIMILAR METAL WELDS OR BUTTERING

WB-4624 Methods of Postweld Heat Treatment

The postweld heat treatment shall be performed in accordance with the requirements of one of the following subparagraphs.

WB-4624.1 Furnace Heating - One Heat.

Heating the item in a closed furnace in one heat is the preferred procedure and should be used whenever practical. The furnace atmosphere shall be controlled so as to avoid excessive oxidation and direct impingement of flame on the component or item is prohibited.

WB-4624.2 Furnace Heating - More Than One Heat.

The item may be heated in more than one heat in a furnace, provided the furnace atmosphere control requirements of WB-4624.1 apply and overlap of the heated sections of the component or item is at least 5 ft (1.5 m). When this procedure is used, the portion of the component or item outside the furnace shall be shielded so that the temperature gradient is not harmful. The cross section where the component or item projects from the furnace shall not intersect a nozzle or other structural discontinuity.

WB-4624.3 Local Heating.

Welds may be locally postweld heat treated when it is not practical to heat treat the entire component or item. Local postweld heat treatment shall consist of heating a circumferential band around the component or item at temperature within the ranges specified in this Subarticle. The minimum width of the controlled band at each side of the weld, on the face of the greatest weld width, shall be the thickness of the weld or 2 in. (51 mm), whichever is less. The temperature of the component or item from the edge of the controlled band outward shall be gradually diminished so as to avoid harmful thermal gradients. This procedure may also be used for postweld heat treatment after repairs.

WB-4624.4 Heating Items Internally.

The component or item may be heated internally by any appropriate means and with adequate indicating and recording temperature devices to aid in the control and maintenance of a uniform distribution of temperature in the item. Previous to this operation, the item should be fully enclosed with insulating material.

WB-4630 HEAT TREATMENT OF WELDS OTHER THAN THE FINAL POSTWELD HEAT TREATMENT

The holding temperature, the time at temperature, the heating rate, and the cooling rate need not conform to the requirements of this Article for heat treatments other than the final postweld heat treatment.

WB-4650 HEAT TREATMENT AFTER BENDING OR FORMING FOR PIPES, PUMPS, AND VALVES

WB-4651 Conditions Requiring Heat Treatment After Bending or Forming

(a) Ferritic alloy steel pipe or formed portions of pumps or valves that have been heated for bending or other forming operations shall receive a heat treatment in accordance with WB-4620, a full anneal, a normalizing and tempering treatment, or a quenching and tempering treatment.

(b) Carbon steel pipe or formed portions of pumps or valves with a wall thickness greater than $\frac{3}{4}$ in. (19 mm) included in group P-No. 1 in Section IX that have been cold bent or formed shall receive heat treatment in accordance with WB-4620.

(c) Ferritic alloy pipe or formed portions of pumps or valves with an outside diameter greater than 4 in. (102 mm) and a wall thickness greater than $\frac{1}{2}$ in. (13 mm) included in groups P-No. 3 through P-No. 5 in Section IX that have been cold

bent or formed shall require a heat treatment in accordance with WB-4620.

WB-4652 Exemptions From Heat Treatment After Bending or Forming

If the conditions described in (a) through (d) below are met, heat treatment after bending or forming is not required.

(a) Carbon steel pipe or portions of pumps and valves that have been bent or formed at a temperature of 1650°F (900°C) or higher shall require no subsequent heat treatment, provided the requirements of WB-4213 have been met.

(b) Austenitic stainless steel pipe, or portions of pumps or valves that have been heated for bending or other forming operations, may be used in the as-bent condition unless the Design Specifications require a heat treatment following bending or forming.

(c) Austenitic stainless steel pipe, or portions of pumps or valves that have been cold bent or formed, may be used in the as-bent condition unless the Design

Page 179

Specifications require a heat treatment following bending or forming.

(d) Carbon steel and ferritic alloy steel pipe, or portions of pumps or valves with sizes and wall thicknesses less than specified in WB-4651(b) and WB-4651(c), may be cold bent or formed without a heat treatment following bending.

WB-4660 HEAT TREATMENT OF ELECTROSLAG WELDS

Electroslag welds in ferritic materials over 1½ in. (38 mm) in thickness at the joints shall be given a grain refining heat treatment.

WB-4700 MECHANICAL JOINTS

WB-4710 BOLTING AND THREADING

WB-4711 Thread Engagement

The threads of all bolts or studs shall be engaged in accordance with the design.

WB-4712 Thread Lubricants

Any lubricant or compound used in threaded joints shall be suitable for the service conditions and shall not react unfavorably with either the service fluid or any component material in the system.

WB-4713 Removal of Thread Lubricants

All threading lubricants or compounds shall be removed from surfaces which are to be seal welded.

WB-4720 BOLTING FLANGED JOINTS

In bolting gasketed flanged joints, the contact faces of the flanges shall bear uniformly on the gasket and the gasket shall be properly compressed in accordance with the design principles applicable to the type of gasket used. All flanged joints shall be made up with relatively uniform bolt stress.

WB-4730 ELECTRICAL AND MECHANICAL PENETRATION ASSEMBLIES

Tubes or pipes of NPS 2 (DN 50) and less may be joined to a penetration assembly in accordance with the rules of WB-4350.

July 1, 1998

American Society Of Mechanical Engineers

SEC III D3 WB-5000

ARTICLE WB-5000 EXAMINATION

Page 181

WB-5100 GENERAL REQUIREMENTS FOR EXAMINATION

WB-5110 PROCEDURES, QUALIFICATIONS, AND EVALUATION

WB-5111 General Requirements

Nondestructive examinations shall be conducted in accordance with the examination methods of Section V, except as they may be modified by the requirements of this Article. Radiographic examination shall be by film radiography or real time radioscopy in accordance with Section V, Article 2, except that fluorescent screens are not permitted for film radiography, the geometric unsharpness shall not exceed the limits of T-285, and the penetrameters of Table WB-5111-1 shall be used in lieu of those shown in Table T-276. The requirements for the retention of radioscopy images are the same as for film radiography. Ultrasonic examination shall be in accordance with Section V, Article 5; magnetic particle examination shall be in accordance with Section V, Article 7; liquid penetrant examination shall be in accordance with Section V, Article 6; and leak testing shall be in accordance with Section V, Article 10, T-1030. The examinations required by this Article, or by reference to this Article, shall be performed by personnel who have been qualified as required by this Article. The results of the examinations shall be evaluated in accordance with the acceptance standards of this Article.

WB-5112 Nondestructive Examination Procedures

All nondestructive examinations required by this Article shall be performed in accordance with detailed written procedures which have been proven by actual demonstration to the satisfaction of the Inspector. The procedures shall comply with the appropriate Article of Section V for the particular examination method. The digitization of radiographic film and radioscopy images shall meet the requirements of Section V, Article 2, Mandatory Appendix III, "Digital Image Acquisition, Display, and Storage for Radiography and Radioscopy." Written procedures and records of demonstration of procedure capability and personnel qualification shall be made available to the Inspector on request. At least one copy of the procedure shall be readily available to all applicable nondestructive examination personnel for reference and use.

WB-5113 Post-Examination Cleaning

Following any nondestructive examination in which examination materials are applied to the piece, the piece shall be thoroughly cleaned in accordance with applicable material or procedure specifications.

WB-5120 TIME OF EXAMINATION OF WELDS AND WELD METAL CLADDING

Acceptance examinations of welds and weld metal cladding required by WB-5200 shall be performed at the times stipulated in (a) through (g) below during fabrication and installation.

(a) Radiographic examination of welds shall be performed after an intermediate¹ or final postweld heat treatment, when required, except as provided in (1) and (2) below.

(1) Radiographic examination of welds in piping, pumps, and valves fabricated of P-No. 1 materials may be performed prior to any required postweld heat treatment.

¹ An intermediate postweld heat treatment for this purpose is defined as a postweld heat treatment performed on a weld within a temperature range not lower than the minimum holding temperature range to which the weld shall be subjected during the final postweld heat treatment.

(2) Radiographic examination of welds in vessels fabricated of P-No. 1 materials and all welds in components fabricated of P-No. 3 materials may be performed

Page 184

prior to an intermediate or final postweld heat treatment, provided the welds are ultrasonically examined after an intermediate or final postweld heat treatment. The ultrasonic examination and acceptance standards shall be in accordance with this Article.

NOTE:

(1) Hole (plaque) type penetrameters may be used on flat plates and on objects with geometries such that the penetrameter hole image is not distorted.

TABLE WB-5111-1 THICKNESS, PENETRAMETER DESIGNATIONS, ESSENTIAL HOLES, AND WIRE DIAMETERS

(b) Magnetic particle or liquid penetrant examinations of welds shall be performed after any required postweld heat treatment, except that welds in P-No. 1 material may be examined either before or after postweld heat treatment. The magnetic particle or liquid penetrant examination of welds at progressive stages of welding, as required in WB-5245 and WB-5246, may be performed before PWHT.

(c) All dissimilar metal weld joints, such as in austenitic or high nickel to ferritic material, or using austenitic or high nickel alloy filler metal to join ferritic materials which penetrate the wall, shall be examined after final postweld heat treatment.

(d) The magnetic particle or liquid penetrant examination of weld surfaces that are to be covered with weld metal cladding shall be performed before the weld metal cladding is deposited. The magnetic particle or liquid penetrant examination of weld surfaces that are not accessible after a postweld heat treatment shall be performed prior to the operation which caused this inaccessibility. These examinations may be performed before PWHT.

(e) Weld metal cladding shall be examined after either an intermediate¹ or final postweld heat treatment, except the examination of weld metal cladding on P-Nos. 1, 3, and 11 materials may be performed before or after the intermediate¹ or final postweld heat treatment.

(f) All of the joints in austenitic stainless steel and nonferrous material shall be examined by the liquid penetrant method after an intermediate or final postweld heat treatment, if any, is performed. This requirement does not apply to tube-to-tubesheet joints.

(g) Ultrasonic examination of electroslog welds in ferritic materials shall be performed after a grain refining heat treatment, when performed, or after final postweld heat treatment.

WB-5130 EXAMINATION OF WELD EDGE PREPARATION SURFACES

material 2 in. (51 mm) or more in thickness shall be examined by the magnetic particle or liquid penetrant method. Indications shall be evaluated in accordance with the acceptance standards of (a), (b), and (c) below.

(a) Only indications with major dimensions greater than $\frac{1}{16}$ in. (1.6 mm) shall be considered relevant imperfections.

(b) Laminar-type imperfections are acceptable without repair if they do not exceed 1 in. (25 mm) in length. The extent of all laminar-type imperfections exceeding 1 in. (25 mm) in length shall be determined by ultrasonic examination. Imperfections exceeding 1 in. (25 mm) in length shall be repaired by welding to a depth of $\frac{3}{8}$ in. (10 mm) or the depth of the imperfection, whichever is less, unless the ultrasonic examination reveals that additional depth of repair is required to meet the ultrasonic examination requirement for the product form.

(c) Indications of nonlaminar imperfections of (1) through (3) below are unacceptable:

(1) any linear indications greater than $\frac{3}{16}$ in. (4.8 mm) long;

(2) rounded indications with dimensions greater than $\frac{3}{16}$ in. (4.8 mm);

(3) four or more indications, in a line separated by $\frac{1}{16}$ in. (1.6 mm) or less, edge to edge.

(d) Weld repairs made to weld edge preparations for Category A, B, C, D, or similar type welds shall be examined by the magnetic particle or liquid penetrant method before the surfaces become inaccessible. The examination may be performed before or after postweld heat treatment.

WB-5140 EXAMINATION OF ADJACENT BASE MATERIAL

When performing the surface examinations of weld joint Categories A, B, C, and D and the equivalent welded joints in piping and valves as required by WB-5200, the external and accessible internal weld surfaces and adjacent base material for at least $\frac{1}{2}$ in. (13 mm) on each side of the weld shall be included in the examination. Acceptance standards for the weld shall be as stated in this Article while the acceptance standards for base material shall be as stated in WB-2500.

WB-5200 REQUIRED EXAMINATION OF WELDS

WB-5210 CATEGORY A VESSEL WELDED JOINTS AND LONGITUDINAL WELDED JOINTS IN OTHER COMPONENTS

Category A welded joints in vessels and longitudinal welded joints in other components shall be examined by the radiographic and either the liquid penetrant or magnetic particle method.

WB-5220 CATEGORY B VESSEL WELDED JOINTS AND CIRCUMFERENTIAL WELDED JOINTS IN PIPING AND VALVES

WB-5221 Vessel Welded Joints

Category B welded joints in vessels shall be examined by the radiographic and either the liquid penetrant or magnetic particle method.

WB-5222 Piping and Valve Circumferential Welded Joints

(a) Butt welded joints shall be examined by the radiographic and either the liquid penetrant or magnetic particle method.

(b) Fillet and partial penetration welded joints shall be examined by either the liquid penetrant or magnetic particle method.

WB-5230 CATEGORY C VESSEL WELDED JOINTS AND SIMILAR WELDED JOINTS IN OTHER COMPONENTS

WB-5231

(a) Category C full penetration butt welded joints in vessels and similar welded joints in other components shall be examined by the radiographic and either the liquid penetrant or magnetic particle method.

(b) Category C full penetration corner welded joints and similar welded joints in other components shall be ultrasonically or radiographically examined and either liquid penetrant or magnetic particle examined.

(c) Type 2 Category C full penetration corner welded joints similar to Fig. WB-4243-1 sketches (d), (e), and (f) also require the fusion zone and the parent metal beneath the attachment surface to be ultrasonically

Page 186

examined after welding to verify freedom from lack of fusion and laminar defects.

(d) Category C partial penetration and fillet welded joints, and similar welded joints in other components shall be examined by either the magnetic particle or liquid penetrant method on all accessible surfaces.

WB-5240 CATEGORY D VESSEL WELDED JOINTS AND BRANCH AND PIPING CONNECTIONS IN OTHER COMPONENTS

WB-5241 General Requirements

All Category D welded joints in vessels and similar welded joints in other components shall be examined as stated in the following paragraphs.

WB-5242 Full Penetration Butt Welded Nozzles, Branch, and Piping Connections

Nozzles, branch, and piping connections attached by full penetration butt welded joints as shown in Fig. WB-4244(a)-1 shall be examined by the radiographic and either the liquid penetrant or magnetic particle method.

WB-5243 Corner Welded Nozzles, Branch, and Piping Connections

(a) Full penetration corner welded nozzles in vessels as shown in Fig. WB-4244(b)-1 shall be examined by either the ultrasonic or the radiographic method, and either the liquid penetrant or magnetic particle method. If radiographed, the weld fusion zone and the parent metal beneath the attachment surface for details shown in Fig. WB-4244(b)-1 sketches (a), (b), (c), (d), (e), and (g) shall be ultrasonically examined after welding to assure freedom from lack of fusion and laminar defects.

(b) Full penetration corner welded branch and piping connections exceeding NPS 4 (DN 100) in piping, pumps, and valves, as shown in Fig. WB-4244(b)-1, shall be examined by either the ultrasonic or the radiographic method, and either the liquid penetrant or magnetic particle method.

(c) Full penetration corner welded branch and piping connections with NPS 4 (DN 100) and less in piping, pumps, and valves shall be examined by either the magnetic particle or liquid penetrant method.

WB-5244 Weld Metal Buildup at Openings for Nozzles, Branch, and Piping Connections

(a) When weld metal buildup is made to a surface as shown in Step 1 of Fig. WB-4244(c)-1, the weld metal buildup, the fusion zone, and the parent metal beneath the weld metal buildup shall be ultrasonically examined to ensure freedom from lack of fusion and laminar defects. Nozzles, branch, and piping connections may then be attached by a full penetration weld as shown in Step 2 of Fig. WB-4244(c)-1. The full penetration butt welded joint shall be examined by either the ultrasonic or radiographic method, and either the liquid penetrant or magnetic particle method.

(b) For branch and piping connections with NPS 4 (DN 100) and less in piping, pumps, and valves, full penetration welds shown in sketch (c) of Fig. WB-4244(c)-1 shall be examined in accordance with WB-5243(c).

WB-5245 Partial Penetration Welded Joints

Partial penetration welded joints, as permitted in WB-3352.4(d), and as shown in Figs. WB-4244(d)-1 and WB-4244(d)-2, shall be examined progressively using either the magnetic particle or liquid penetrant methods. The

increments of examination shall be the lesser of one-half of the maximum welded joint dimension measured parallel to the center line of the connection or $\frac{1}{2}$ in. (13 mm). The surface of the finished welded joint shall also be examined by either method.

WB-5246 Oblique Full Penetration Nozzles, Branch, and Piping Connections

(a) Full penetration oblique nozzles in vessels as shown in Fig. WB-4244(e)-1 shall be examined by either the ultrasonic or radiographic method, and either the liquid penetrant or magnetic particle method. In addition, the weld, the fusion zone, and the parent metal beneath the attachment surface for details shown in Fig. WB-4244(e)-1, sketches (a), (b), and (c) shall be ultrasonically examined after welding to assure freedom from lack of fusion and laminar defects.

(b) Full penetration oblique welded joint branch and piping connections in piping, pumps, and valves, as shown in Fig. WB-4244(e)-1, shall be examined in accordance with the requirements for corner welded branch and piping connections specified in WB-5243(b) and (c), as applicable.

Page 187

WB-5260 FILLET, PARTIAL PENETRATION, SOCKET, AND ATTACHMENT WELDED JOINTS

WB-5261 Fillet, Partial Penetration, and Socket Welded Joints

Fillet and partial penetration welded joints, except for nonstructural attachments (WB-1132.1), and socket welds shall be examined by the magnetic particle or liquid penetrant method.

WB-5262 Structural Attachment Welded Joints

Structural attachment welded joints made to pressure retaining material shall be examined by either the magnetic particle or liquid penetrant method.

WB-5270 SPECIAL WELDED JOINTS

WB-5271 Welded Joints of Specially Designed Seals

Welded joints of this type shall be examined by either the magnetic particle or liquid penetrant method.

WB-5272 Weld Metal Cladding

Weld metal cladding shall be examined by the liquid penetrant method.

WB-5273 Hard Surfacing

Hard surfacing weld metal shall be examined by the liquid penetrant method in accordance with WB-2546, and the acceptance standards applicable to materials less than $\frac{5}{8}$ in. (16 mm) thick shall apply. Penetrant examination is not required for hard surfacing on valves with inlet connections NPS 4 (DN 100) or less.

WB-5274 Tube-to-Tubesheet Welded Joints

Tube-to-tubesheet welded joints shall be examined by the liquid penetrant method.

WB-5275 Brazed Joints

Flux and flux residue shall be removed from all surfaces prior to examination. Joints shall be visually examined on all accessible surfaces to determine whether there has been adequate flow of brazing metal through the joint. Optical aids may be employed for indirect visual examination of joints which cannot be directly examined.

WB-5276 Inertia and Continuous Drive Friction Welds

(a) When radiographic examination is required by this Article, inertia and continuous drive friction welds shall also be

examined by the ultrasonic method to verify bonding over the entire area.

(b) The materials used shall be those assigned a P-Number by Section IX, but shall not include rimmed or semikilled steel.

(c) One of the two parts to be joined must be held in a fixed position and the other part rotated. The two faces to be joined must be symmetrical with respect to the axis of rotation.

(d) The weld between the two members shall be a full penetration weld.

WB-5277 Electron Beam Welds

In addition to the requirements for the type of weld being examined, all complete penetration welds made by the electron beam welding process shall be ultrasonically examined.

WB-5278 Electroslag Welds

In addition to the requirements for the type of weld being examined, all complete penetration welds made by the electroslag welding process in ferritic materials shall be ultrasonically examined.

WB-5279 Special Exceptions

When the joint detail does not permit radiographic examination to be performed in accordance with procedures of this Subsection for joints attaching penetration assemblies, which are fabricated as appurtenances or of the closing seam within an electrical penetration assembly, not necessarily fabricated as an appurtenance, ultrasonic examination plus liquid penetrant or magnetic particle examination of the completed weld may be substituted for the radiographic examination. The absence of suitable radiographic equipment shall not be justification for such substitution. The substitution of ultrasonic examination can be made provided the examination is performed using a detailed written procedure which has been proven by actual demonstration to the satisfaction of the Inspector as capable of detecting and locating defects described in this Division. The nondestructive examination shall be in accordance with Section V and meet the acceptance standards of WB-5300.

Page 188

WB-5300 ACCEPTANCE STANDARDS

WB-5320 RADIOGRAPHIC ACCEPTANCE STANDARDS

Indications shown on the radiographs of welds and characterized as imperfections are unacceptable under the following conditions:

(a) any indication characterized as a crack or zone of incomplete fusion or penetration;

(b) any other elongated indication which has a length greater than:

(1) $\frac{1}{4}$ in. for t up to $\frac{3}{4}$ in., inclusive

(2) $\frac{1}{3}t$ for t from $\frac{3}{4}$ in. to $2\frac{1}{4}$ in., inclusive

(3) $\frac{3}{4}$ in. for t over $2\frac{1}{4}$ in.

where t is the thickness of the thinner portion of the weld;

(c) internal root weld conditions are acceptable when the density change as indicated in the radiograph is not abrupt; elongated indications on the radiograph at either edge of such conditions shall be unacceptable, as provided in (b) above;

(d) any group of aligned indications having an aggregate length greater than t in a length of $12t$, unless the minimum distance between successive indications exceeds $6L$, in which case the aggregate length is unlimited, L being the length of the largest indication;

(e) rounded indications in excess of that shown as acceptable in Appendix VI.

WB-5330 ULTRASONIC ACCEPTANCE STANDARDS

All imperfections which produce a response greater than 20% of the reference level shall be investigated to the extent that the operator can determine the shape, identity, and location of all such imperfections and evaluate them in terms of the acceptance standards given in (a) and (b) below.

(a) Imperfections are unacceptable if the indications exceed the reference level amplitude and have lengths exceeding:

- (1) $\frac{1}{4}$ in. for t up to $\frac{3}{4}$ in., inclusive
- (2) $\frac{1}{3}t$ for t from $\frac{3}{4}$ in. to $2\frac{1}{4}$ in., inclusive
- (3) $\frac{3}{4}$ in. for t over $2\frac{1}{4}$ in.

where t is the thickness of the weld being examined; if a weld joins two members having different thicknesses at the weld, t is the thinner of these two thicknesses.

(b) Indications characterized as cracks, lack of fusion, or incomplete penetration are unacceptable regardless of length.

WB-5340 MAGNETIC PARTICLE ACCEPTANCE STANDARDS

WB-5341 Evaluation of Indications

(a) Mechanical discontinuities at the surface are revealed by the retention of the examination medium. All indications are not necessarily defects, however, since certain metallurgical discontinuities and magnetic permeability variations may produce similar indications which are not relevant.

(b) Any indication that is believed to be nonrelevant shall be reexamined by the same or other nondestructive examination methods to verify whether or not actual defects are present. Surface conditioning may precede the reexamination. After an indication has been verified to be nonrelevant, it is not necessary to reinvestigate repetitive nonrelevant indications of the same type. Nonrelevant indications that would mask defects are unacceptable.

(c) Relevant indications are indications which result from imperfections. Linear indications are indications in which the length is more than three times the width. Rounded indications are indications which are circular or elliptical with the length equal to or less than three times the width.

WB-5342 Acceptance Standards

(a) Only imperfections producing indications with major dimensions greater than $\frac{1}{16}$ in. (1.6 mm) shall be considered relevant imperfections.

(b) Imperfections producing the following indications are unacceptable:

- (1) any cracks and linear indications;
- (2) rounded indications with dimensions greater than $\frac{3}{16}$ in. (4.8 mm);
- (3) four or more rounded indications in a line separated by $\frac{1}{16}$ in. (1.6 mm) or less edge to edge;
- (4) ten or more rounded indications in any 6 sq in. (3,871 mm²) of surface with the major dimension of this area not to exceed 6 in. (152 mm) with the area taken in the most unfavorable location relative to the indications being evaluated.

WB-5350 LIQUID PENETRANT ACCEPTANCE STANDARDS

WB-5351 Evaluation of Indications

(a) Mechanical discontinuities at the surface are revealed by bleeding out of the penetrant; however, localized surface discontinuities, such as may occur from machining marks, surface conditions, or an incomplete

bond between base metal and cladding, may produce similar indications which are nonrelevant.

(b) Any indication which is believed to be nonrelevant shall be reexamined to verify whether or not actual defects are present. Surface conditioning may precede the reexamination. Nonrelevant indications and broad areas of pigmentation which would mask defects are unacceptable.

(c) Relevant indications are indications which result from imperfections. Linear indications are indications in which the length is more than three times the width. Rounded indications are indications which are circular or elliptical with the length equal to or less than three times the width.

WB-5352 Acceptance Standards

(a) Only imperfections producing indications with major dimensions greater than $\frac{1}{16}$ in. (1.6 mm) shall be considered relevant imperfections.

(b) Imperfections producing the following indications are unacceptable:

(1) any cracks or linear indications;

(2) rounded indications with dimensions greater than $\frac{3}{16}$ in. (4.8 mm);

(3) four or more rounded indications in a line separated by $\frac{1}{16}$ in. (1.6 mm) or less edge to edge;

(4) ten or more rounded indications in any 6 sq in. (3,871 mm²) of surface with the major dimension of this area not to exceed 6 in. (152 mm) with the area taken in the most unfavorable location relative to the indications being evaluated.

WB-5360 VISUAL ACCEPTANCE STANDARDS FOR BRAZED JOINTS

Braze metal shall give evidence of having flowed uniformly through a joint by the appearance of an uninterrupted, narrow visible line of brazing alloy at the end of the joint.

WB-5380 BUBBLE FORMATION TESTING

Bubble formation testing shall be in accordance with Section V, Article 10. When vacuum box testing is used, the soak time shall be a minimum of 10 sec. Any indication of leaking, by the formation of bubbles or by the breaking of the continuous soap film by leaks, shall be evidence of an unacceptable condition.

WB-5400 FINAL EXAMINATION OF VESSELS

WB-5410 EXAMINATION AFTER HYDROSTATIC TEST

After the hydrostatic or pneumatic test of a vessel, all weld joints and heat affected zones of Categories A, B, C, and D, used to join ferritic material and repair welds in ferritic material that exceed in depth either $\frac{3}{8}$ in. (10 mm) or 10% of the section thickness, whichever is less, shall be examined when physically accessible by the magnetic particle or liquid penetrant method.

WB-5500 QUALIFICATIONS AND CERTIFICATION OF NONDESTRUCTIVE EXAMINATION PERSONNEL

WB-5510 GENERAL REQUIREMENTS

Organizations performing Code required nondestructive examinations shall use personnel competent and knowledgeable to the degree specified by WB-5520. When these services are subcontracted by the Certificate Holder or Quality System Certificate Holder, he shall verify the qualification of personnel to the requirements of WB-5520. All nondestructive examinations required by this Subsection shall be performed by and the results evaluated by qualified nondestructive examination personnel.

WB-5520 PERSONNEL QUALIFICATION, CERTIFICATION, AND VERIFICATION

WB-5521 Qualification Procedure

guidelines of SNT-TC-1A.^{2,3} The Employer's⁴ written practice, required by paragraph 5 of SNT-TC-1A, shall identify the requirements relative to the recommended guidelines. The recommended guidelines of SNT-TC-1A shall be considered as minimum requirements, except as modified in (1) through (5) below.

(1) Qualification of Level III nondestructive examination personnel shall be by examination.

(a) The basic and method examinations, paragraphs 8.3.3(1) and 8.3.3(2) of SNT-TC-1A, may be prepared and administered by Employer,⁴ ASNT, or an outside agency.

(b) The specific examination, paragraph 8.3.3(3) of SNT-TC-1A, shall be prepared and administered by the Employer or an outside agency. The Employer or outside agency administering the specific examination shall identify the minimum grade requirement in the written program when the basic and method examinations have been administered by ASNT, which issues grades on a pass/fail basis. In this case, the minimum grade for the specific examination may not be less than 80%.

(2) The written practice identified in paragraph 5 of SNT-TC-1A and the procedures used for examination of personnel shall be referenced in the Employer's Quality Program.

(3) The number of hours of training and experience for nondestructive examination personnel who perform only one operation of a nondestructive examination method that consists of more than one operation, or perform nondestructive examination of limited scope, may be less than that recommended in Table 6.3.1 of SNT-TC-1A. The time of training and experience shall be described in the written practice, and any limitations or restrictions placed on the certification shall be described in the written practice and on the certificate.

(4) For visual examination, the Jaeger Number 1 letters shall be used in lieu of the Jaeger Number 2 letters specified in paragraph 8.1.1(1) of SNT-TC-1A. The use of equivalent type and size letters is permitted.

2 SNT-TC-1A is a Recommended Practice for Nondestructive Testing Personnel Qualification and Certification published by the American Society for Nondestructive Testing, 4153 Arlingate Plaza, Columbus, OH 43228-0518. SNT-TC-1A-1984 is the applicable edition.

3 Personnel qualified by examination and certified to the previous editions of SNT-TC-1A are considered to be qualified to the 1984 edition when the recertification is based on continuing satisfactory performance. All reexaminations and new examinations shall be in accordance with the 1984 edition.

4 Employer as used in this Article shall include: N Certificate Holders; Quality System Certificate Holders; Material Organizations who are qualified in accordance with WA-3862.1(a) and organizations who provide subcontracted nondestructive examination services to organizations described above.

(5) A Level I individual shall be qualified to perform specific setups, calibrations, and tests, and to record and evaluate data by comparison with specific acceptance criteria defined in written instructions. The Level I individual shall implement these written NDE instructions under the guidance of a Level II or Level III individual. A Level I individual may independently accept the results of nondestructive examinations when the specific acceptance criteria are defined in the written instructions.

(b) For nondestructive examination methods not covered by SNT-TC-1A documents, personnel shall be qualified to comparable levels of competency by subjection to comparable examinations on the particular method involved.

(c) The emphasis shall be on the individual's ability to perform the nondestructive examination in accordance with the applicable procedure for the intended application.

(d) For nondestructive examination methods that consist of more than one operation or type, it is permissible to use personnel qualified to perform one or more operations. As an example, one person may be used who is qualified to conduct radiographic examination and another may be used who is qualified to interpret and evaluate the radiographic film.

WB-5522 Certification of Personnel

(a) The Employer retains responsibility for the adequacy of the program and is responsible for certification of Levels I, II, and III nondestructive examination personnel.

(b) When ASNT is the outside agency administering the Level III basic and method examinations [WB-5521(a)(1)(a)], the Employer may use a letter from ASNT as evidence on which to base the certification.

(c) When an outside agency is the examining agent for Level III qualification of the Employer's personnel, the examination results shall be included with the Employer's record.

WB-5523 Verification of Nondestructive Examination Personnel Certification

The Certificate Holder has the responsibility to verify the qualification and certification of nondestructive examination personnel employed by Material Organizations and qualified by them in accordance with

Page 191

WA-3820 and subcontractors who provide nondestructive examination services to them.

WB-5530 RECORDS

Personnel qualification records identified in paragraph 9.6.1 of SNT-TC-1A shall be retained by the Employer.

July 1, 1998

American Society Of Mechanical Engineers

SEC III D3 WB-6000

ARTICLE WB-6000 TESTING

Page 193

Page 194

WB-6100 GENERAL REQUIREMENTS

WB-6110 PRESSURE TESTING OF COMPONENTS, APPURTENANCES, AND SYSTEMS

WB-6111 Scope of Pressure Testing

All pressure retaining components, appurtenances, and completed systems shall be pressure tested. The preferred method shall be a hydrostatic test using water as the test medium. Bolts, studs, nuts, washers, and gaskets are exempted from the pressure test.

WB-6112 Pneumatic Testing

A pneumatic test in accordance with WB-6300 may be substituted for the hydrostatic test when permitted by WB-6112.1 (a).

WB-6112.1 Pneumatic Test Limitations

(a) A pneumatic test may be used in lieu of a hydrostatic test only when any of the following conditions exists:

(1) when components, appurtenances, or systems are so designed or supported that they cannot safely be filled with liquid¹

(2) when components, appurtenances, or systems which are not readily dried are to be used in services where traces of the testing medium cannot be tolerated.

(b) A pneumatic test at a pressure not to exceed 25% of the MNOP may be applied, prior to either a hydrostatic or a pneumatic test, as a means of locating leaks.

1 These tests may be made with the item being tested partially filled with liquid, if desired.

WB-6112.2 Precautions to Be Employed in Pneumatic Testing.

Compressed gaseous fluid is hazardous when used as a testing medium. Therefore, it is recommended that special precautions for protection of personnel be taken when a gaseous fluid under pressure is used as a test medium.

WB-6113 Witnessing of Pressure Tests

Pressure testing required by this Article shall be performed in the presence of the Inspector, except that testing of each line valve and each pump having piping connections of NPS 4 (DN 100) and less need not be witnessed by the Inspector. For line valves NPS 4 (DN 100) and less, the Inspector's review and acceptance of the Certificate Holder's test records will be authorization to sign the Data Report Form and take precedence over WA-5280.

WB-6114 Time of Pressure Testing

WB-6114.1 System Pressure Test.

The installed system shall be pressure tested prior to initial operation.

(a) The pressure test may be performed progressively on erected portions of the system.

(b) Systems which are open ended, such as spray systems, may be pressure tested with the nozzle attachment opening plugged. The spray nozzles and their attachment weld joints or mechanical joints need not be pressure tested.

WB-6114.2 Component and Appurtenance Pressure Test

(a) Components and appurtenances shall be pressure tested prior to installation in a system, except as permitted in (b) below.

(b) The system pressure test may be substituted for a component or appurtenance pressure test, provided:

(1) the component can be repaired by welding in accordance with the rules of WB-4130 and WB-4450, if required, as a result of the system pressure test;

(2) the component repair weld can be postweld heat treated in accordance with WB-4620, if required, and nondestructively examined in accordance with the rules of WB-4130 and WB-4450, as applicable;

Page 196

(3) the component is resubjected to the required system pressure test following the completion of repair and examination if the repair is required to be radiographed by WB-4453.4.

(c) Valves require pressure testing prior to installation in a system in accordance with WB-3500.

(d) Items which, when assembled, form a completed valve may be tested in the form of subassemblies, provided:

(1) the test pressure is in accordance with the requirements of WB-6221;

(2) the pressure test is performed in a manner which, in the subassembly under test, will simulate the loadings present when the completed pump or valve is assembled and pressurized;

(3) the component Certificate Holder approves any pressure test of component subassemblies;

(4) the component Certificate Holder specifies the pressure test requirements and test pressure to be used;

(5) each subassembly pressure test is performed by a Certificate Holder and is performed in the presence of the Authorized Inspector;

(6) each subassembly pressure tested by other than the component Certificate Holder is stamped with the NPT symbol, except as provided in WA-8330. The test pressure shall be identified on the Partial Data Report Form.

(7) each subassembly pressure tested by other than the component Certificate Holder is listed on the Code Data Report Form;

(8) the pressure tested subassemblies of pumps or valves are subsequently assembled by mechanical methods only;

(9) welds examined during the subassembly pressure test need not be reexamined during the system pressure test.

WB-6114.3 Material Pressure Test.

The component or appurtenance pressure test may be used in lieu of any such test required by the material specification for a part or material used in the component or appurtenance, provided:

(a) nondestructive examinations, if required by the material specification, can be performed subsequent to the component or appurtenance pressure test;

(b) the material can be repaired by welding in accordance with the rules of WB-4130, if required, as a result of the pressure test;

(c) postweld heat treatment, when required after repairs, can be performed in accordance with WB-4620.

WB-6115 Machining After Pressure Test

An additional amount of material, not to exceed 10% of the wall thickness or $\frac{3}{8}$ in. (10 mm), whichever is less, is permitted on the completed component during pressure testing where machining to critical dimensions and tolerances is required.

WB-6120 PREPARATION FOR TESTING

WB-6121 Exposure of Joints

All joints, including welded joints, shall be left uninsulated and exposed for examination during the test.

WB-6122 Addition of Temporary Supports

Components designed to contain vapor or gas may be provided with additional temporary supports, if necessary, to support the weight of the test liquid.

WB-6123 Restraint or Isolation of Expansion Joints

Expansion joints shall be provided with temporary restraints, if required, for the additional pressure load under test.

WB-6124 Isolation of Equipment Not Subjected to Pressure Test

Equipment that is not to be subjected to the pressure test shall be either disconnected from the component or system or isolated during the test by a blind flange or similar means. Valves may be used if the valves with their closures are suitable for the proposed test pressure.

WB-6125 Treatment of Flanged Joints Containing Blanks

Flanged joints at which blanks are inserted to isolate other equipment during the test need not be retested.

WB-6126 Precautions Against Test Medium Expansion

If a pressure test is to be maintained for a period of time and the test medium in the system is subject to thermal expansion, precautions shall be taken to avoid excessive pressure.

Page 197

WB-6127 Check of Test Equipment Before Applying Pressure

The test equipment shall be examined before pressure is applied to ensure that it is tight and that all low pressure filling lines and other items that should not be subjected to the test have been disconnected or isolated.

WB-6200 HYDROSTATIC TESTS

WB-6210 HYDROSTATIC TEST PROCEDURE

WB-6211 Venting During Fill Operation

The component or system in which the test is to be conducted shall be vented during the filling operation to minimize air pocketing.

WB-6212 Test Medium and Test Temperature

(a) Water or an alternative liquid, as permitted by the Design Specification, shall be used for the hydrostatic test.

(b) It is recommended that the test be made at a temperature that will minimize the possibility of brittle fracture (Appendix G). The test pressure shall not be applied until the component, appurtenance, or system and the pressurizing fluid are at approximately the same temperature.

WB-6220 HYDROSTATIC TEST PRESSURE REQUIREMENTS

[98]

WB-6221 Minimum Hydrostatic Test Pressure

(a) The installed system shall be hydrostatically tested at not less than either 1.5 times MNOP or 1.25 times MNIP of any component within the boundary protected by the overpressure protection devices which satisfy the requirements of WB-7000.

(b) Valves shall be hydrostatically tested in accordance with the rules of WB-3500.

(c) Components shall be hydrostatically tested at not less than either 1.5 times MNOP or 1.25 times MNIP.

[98]

WB-6222 Maximum Permissible Test Pressure

The stress limits specified in WB-3226 shall be used in determining the maximum permissible test pressure. In multichamber components, pressure may be simultaneously applied to the appropriate adjacent chamber to satisfy these stress limits.

WB-6223 Hydrostatic Test Pressure Holding Time

The hydrostatic test pressure shall be maintained a minimum of 10 min prior to initiation of the examination for leakage required by WB-6224.

WB-6224 Examination for Leakage After Application of Pressure

Following the application of the hydrostatic test pressure for the required time (WB-6223), all joints, connections, and regions of high stress, such as regions around openings and thickness transition sections, shall be examined for leakage. Except in the case of valves which shall be examined while at test pressure, this examination shall be made at a pressure equal to the greater of the MNOP or three-fourths of the test pressure and it shall be witnessed by the Inspector. Leakage of temporary gaskets and seals, installed for the purpose of conducting the hydrostatic test and which will be replaced later, may be permitted unless the leakage exceeds the capacity to maintain system test pressure for the required amount of time. Other leaks, such as those from permanent seals, seats, and gasketed joints in components, may be permitted when specifically allowed by the Design Specification. Leakage from temporary seals or leakage permitted by the Design Specification shall be directed away from the surface of the component to avoid masking leaks from other joints.

WB-6300 PNEUMATIC TESTS

WB-6310 PNEUMATIC TESTING PROCEDURES

WB-6311

WB-6311 General Requirements

When a pneumatic test is performed, it shall be conducted in accordance with the requirements of WB-6100 and this Subarticle.

WB-6312 Test Medium and Test Temperature

(a) The gas used as the test medium shall be nonflammable.

(b) Testing temperature shall be in accordance with WB-6212(b).

Page 198

WB-6313 Procedure for Applying Pressure

The pressure in the system shall gradually be increased to not more than one-half of the test pressure, after which the pressure shall be increased in steps of approximately one-tenth of the test pressure until the required test pressure has been reached.

WB-6320 PNEUMATIC TEST PRESSURE REQUIREMENTS

[98]

WB-6321 Minimum Required Pneumatic Test Pressure

(a) The installed system shall be pneumatically tested at not less than either 1.5 times MNOP or 1.25 times MNIP of any component within the boundary protected by the overpressure protection devices which satisfy the requirements of WB-7000.

(b) Valves shall be pneumatically tested in accordance with the rules of WB-3500.

(c) Components shall be pneumatically tested at not less than either 1.5 times MNOP or 1.25 times MNIP.

[98]

WB-6322 Maximum Permissible Test Pressure

The maximum test pressure shall be limited as defined in WB-6222.

WB-6323 Test Pressure Holding Time

The test pressure of WB-6321 shall be maintained for a minimum total time of 10 min.

WB-6324 Examination for Leakage After Application of Pressure

Following the application of pressure for the time specified in WB-6323, the test pressure shall be reduced to a value equal to the greater of the MNOP or three-fourths of the test pressure and held for a sufficient time to permit examination as defined in accordance with WB-6224.

WB-6400 PRESSURE TEST GAGES

WB-6411 Types of Gages to Be Used and Their Location

Pressure test gages used in pressure testing shall be indicating pressure gages and shall be connected directly to the component. If the indicating gage is not readily visible to the operator controlling the pressure applied, an additional indicating gage shall be provided where it will be visible to the operator for the duration of the test. For systems with a large volumetric content, it is recommended that a recording gage be used in addition to the indicating gages.

WB-6412 Range of Indicating Pressure Gages

(a) Analog type indicating pressure gages used in testing shall be graduated over a range not less than $1\frac{1}{2}$ times nor more

than 4 times the test pressure.

(b) Digital type pressure gages may be used without range restriction provided the combined error due to calibration and readability does not exceed 1% of the test pressure.

WB-6413 Calibration of Pressure Test Gages

All test gages shall be calibrated against a standard dead weight tester or a calibrated master gage. The test gages shall be calibrated before each test or series of tests. A series of tests is that group of tests using the same pressure test gage or gages which is conducted at the same site within a period not exceeding 2 weeks.

WB-6600 SPECIAL TEST PRESSURE SITUATIONS

WB-6610 COMPONENTS DESIGNED FOR EXTERNAL PRESSURE

Components designed for external pressure only shall be subjected to an internal test pressure at 1.25 times the design external pressure. The pressure shall be under proper control so that the required test pressure is never exceeded by more than 6%.

WB-6620 PRESSURE TESTING OF COMBINATION UNITS

WB-6621 Pressure Chambers Designed to Operate Independently

Pressure chambers of combination units that have been designed to operate independently shall be hydrostatically tested as separate vessels; that is, each chamber shall be tested without pressure in the adjacent chamber.

Page 199

WB-6622 Common Elements Designed for a Maximum Differential Pressure

(a) When pressure chambers of combination units have their common elements designed for the maximum differential pressure that can occur during startup, operation, and shutdown, and the differential pressure is less than the higher of the MNOP of the adjacent chambers, the common elements shall be subjected to a hydrostatic test pressure of at least $1\frac{1}{4}$ times the maximum differential pressure.

(b) Following the test of the common elements, as required by (a) above and their inspection, the adjacent chambers shall be hydrostatically tested (WB-6221). Care must be taken to limit the differential pressure between the chambers to the pressure used when testing the common elements.

SEC III SI UNITS

The 1998 Edition of the Boiler and Pressure Vessel Code is based on U.S. Customary (ft-lb) units of measurement which are to be regarded as the standard. This supplement is provided as a convenience to the Code user and contains SI conversion factors for units contained in the Code.

LIST OF SI UNITS FOR USE WITH ASME BOILER AND PRESSURE VESSEL CODE [Note (1)]

Quantity	Unit	Symbol	Other Units or Limitations
Space and Time			
plane angle	radian	rad	degree (decimalized)
length	meter	m	
area	square meter	m ²	
volume	cubic meter	m ³	liter (L) for liquid only (use without prefix other than in milliliter, mL)
time	second	s	minute (min), hour (h), day (d), week, and year
Periodic and Related Phenomena			
frequency	hertz	Hz	revolutions per second (r/s)
rotational frequency	revolutions per second	s ⁻¹	revolutions per minute (r/m)
Mechanics			
mass	kilogram	kg	
density	kilogram per cubic meter	kg/m ³	
moment of inertia	kilogram · meter ²	kg · m ²	
force	newton	N	
moment of force (torque)	newton-meter	N · m	
pressure and stress	pascal	Pa	(pascal = newton per square meter)
energy, work	joule	J	kilowatt-hour (kW · h)
power	watt	W	
impact strength	joule	J	
section modulus	meter ³	m ³	
moment of section (second moment of area)	meter ⁴	m ⁴	
fracture toughness	Pa · $\sqrt{m}$		
Heat			
temperature — thermodynamic [Note (2)]	kelvin	K	degree Celsius (°C)
temperature — other than thermodynamic	degree Celsius	°C	kelvin (K)
linear expansion coefficient	meter per meter-kelvin	K ⁻¹	°C ⁻¹
quantity of heat	joule	J	
heat flow rate	watt	W	
thermal conductivity	watt per meter-kelvin	W/(m · K)	W/(m · °C)
thermal diffusivity	square meter per second	m ² /s	
specific heat capacity	joule per kilogram-kelvin	J/(kg · K)	J/(kg · °C)
Electricity and Magnetism			
electric current	ampere	A	
electric potential	volt	V	
current density	ampere per meter ²	A/m ²	
magnetic field strength	ampere per meter	A/m	

NOTES:

- (1) Conversion factors between SI units and U.S. customary are given in SI-1, "ASME Orientation and Guide for Use of SI (Metric) Units," and ASTM E 380.
- (2) Preferred use for temperature and temperature interval is degrees Celsius (°C), except for thermodynamic and cryogenic work where kelvins may be more suitable. For temperature interval, 1 K = 1°C exactly.

power	hp (550 ft · lbf/s)	W	7.456 999	E+02
fracture toughness	ksi $\sqrt{\text{in}}$	Pa · $\sqrt{\text{m}}$	1.098 843	E+06
temperature	°C	K	$t_K = t_C + 273.15$	
	°F	K	$t_K = (t_F + 459.67)/1.8$	
	°F	°C	$t_C = (t_F - 32)/1.8$	
temperature interval	°C	K	1.0*	E+00
	°F	K or °C	5.555 555	E-01

NOTES:

- (1) Care should be taken when converting formulas or equations that contain constant terms or factors. The value of these terms must be understood and may also require conversion.
- (2)(a) Relationships that are exact in terms of the base units are followed by a single asterisk.
 (b) The factors are written as a number greater than 1 and less than 10 with 6 or less decimal places. The number is followed by the letter E (for exponent), a plus or minus symbol, and two digits which indicate the power of 10 by which the number must be multiplied to obtain the correct value. For example: 3.523 907 E-02 is $3.523\ 907 \times 10^{-2}$ or 0.035 239 07.
